* Value for solid state at −10°C.

HEAT CONDUCTIVITY

In the following tables dealing with heat conductivity, the coefficient λ is given in calories/cm. sec. degree C. This value expresses the quantity of heat in gram calories, transmitted per second through a plate of the material one centimeter thick and one square centimeter in area when the temperature difference between the two sides of the plate is one degree Centigrade. To express λ in English units (B.T.U./inch sec. degree F) multiply the values given below by 0.00560.

HEAT CONDUCTIVITY OF COMMERCIAL INSULATORS

(Calculated from the values in Bu. of Standards Letter Circular No. 227.)

In the table below, the materials are divided into eight classes,* as follows:
Class 1—Soft flexible materials in sheet form.
Class 2—Loose materials.
Class 3—Semi-flexible materials in sheet form.
Class 4—Semi-rigid materials in board form.
Class 5—Stiff fibrous materials in board form.
Class 6—Cellular gypsum.
Class 7—Woods, across grain.
Class 8—Miscellaneous building materials.

To convert the specific gravities to pounds per cubic foot, multiply by 62.43. To convert the values for λ, which are given in calories/cm. sec. degree C to B.T.U./hour, square foot, degree F per inch thickness, multiply by 3303.

Material	Composition	Class	Sp. Gr.	$\lambda \times 10^4$
Balsa	Wood, across grain	7	0.1168	1.0
"		7	0.1408	1.15
"		7	0.32	1.76
Balsam Wool	Chemically treated wood fibre	1	0.0352	0.818

HEAT OF COMBUSTION OF VARIOUS SUBSTANCES

In the table below, gaseous products of combustion are to be assumed unless otherwise stated. See special tables for foods, coals, gases, and organic compounds. To convert gram-calories per gram to B.T.U. per pound, multiply the values below by 1800.

Substance	kg.-cal. per gram
Asphalt	9.532
Castor oil	8.850
Cod liver oil	9.40
Cottonseed oil	9.40
Dynamite (75%)	1.29
Graphite	α 7.840; β 7.856
Guncotton	1.0563
Hemoglobin	5.89
Hydrogen (to H_2O, liq.)	34.18
Hydrogen (to H_2O, steam)	29.15
Linseed oil	9.41
Mining powder	0.5088
Paraffin	10.34
Paraffin oil	9.80

Substance	kg.-cal. per gram
Petroleum	10.30 to 10.33
Pitch	8.4
Rape-seed oil	9.45
Sawdust, pressed	4.065
Spermaceti	9.95
Sulfur, monoclinic (to SO_2)	2.241
Sulfur, rhombic (to SO_2)	2.221
Whale oil	9.47
Wood, beech (13% H_2O)	4.168
Wood, birch (11.8% H_2O)	4.207
Wood, oak (13.3% H_2O)	3.990
Wood, pine (12.2% H_2O)	4.422

HEAT OF COMBUSTION OF ORGANIC COMPOUNDS

(Kharasch, *Bu. Stand. Jour. Research*, Vol. 2, p. 359 (1929))

The heat of combustion is expressed in kilogram calories per gram formula weight of the compound as given in the table; the values are based upon a combustion at atmospheric pressure and at 20°C, the final combustion products consisting of liquid water, gaseous carbon dioxide and gaseous nitrogen. To convert to British Thermal Units (B.T.U.) multiply the value in kg-cal. by 3.9685.

Name	Formula	Physical state	Heat of combustion in kg. cal.
Acetaldehyde	CH_3CHO	liq.	279.0
Acetamide	CH_3CONH_2	solid	282.6

HEAT OF FORMATION OF ORGANIC COMPOUNDS

The heat of formation of an organic compound can be calculated since this value is equal to the sum of the heats of formation of the products of combustion less the heat of combustion (see table: Heat of Combustion of Organic Compounds) of the compound. A positive value indicates an evolution of heat during formation.

The heat of formation of the usual products of combustion of an organic compound are:

Free elements		0 kg-cal.
CO_2	(gas)	94.38 kg-cal.
$\frac{1}{2}H_2O$	(liquid; from one atom of hydrogen)	34.19 kg-cal.
SO_2	(gas)	69.3 kg-cal.
H_2SO_4	(in dilute aqueous solution)	207.5 kg-cal.
HBr	(in dilute aqueous solution)	28.54 kg-cal.
HCl	(in dilute aqueous solution)	39.46 kg-cal.
HF	(in dilute aqueous solution)	75.6 kg-cal.
HNO_3	(in dilute aqueous solution)	49.80 kg-cal.

EXAMPLES

Thus, to calculate the heat of formation of acetaldehyde and where the combustion is represented by the following equation:

$CH_3CHO + 2\frac{1}{2}O_2 = 2CO_2 + 2H_2O$

Heat of combustion of acetaldehyde . . 279.0
Heat of formation of CO_2 . . . . . 94.38
Heat of formation of $\frac{1}{2}H_2O$ 34.19

then, the heat of formation of acetaldehyde = $2(94.38) + 4(34.19) - 279 = +46.52$ kg-cal. for 44 grams (the gram formula weight) of acetaldehyde.

To calculate the heat of formation of acetylene from its heat of combustion where the combustion is represented by the equation:

$C_2H_2 + 2\frac{1}{2}O_2 = 2CO_2 + H_2O$

Heat of combustion of acetylene 312.0
Heat of formation of CO_2 . . . . . 94.38
Heat of formation of $\frac{1}{2}H_2O$ 34.19

then, the heat of formation of acetylene = $2(94.38) + 2(34.19) - 312 = -54.86$ kg-cal. for 26 grams (the gram formula weight) of acetylene.

To calculate the heat of formation of methylamine from the heat of combustion of methylamine when the combustion is represented by the equation:

$CH_3NH_2 + 4\frac{1}{2}O = CO_2 + 2\frac{1}{2}H_2O + \frac{1}{2}N_2$

Heat of combustion of methylamine . . . 256.1
Heat of formation of CO_2 . . . . . 94.38
Heat of formation of $\frac{1}{2}H_2O$ 34.19

then, the heat of formation of methylamine = $94.38 + 5(34.19) + 0(\text{nitrogen}) - 256.1 = +9.23$ kg-cal. for 31 grams (the gram formula weight) of methylamine.

HEATS OF FORMATION OF INORGANIC COMPOUNDS

This table gives the heat of formation expressed in kilogram-calories per gram formula weight; to convert to British Thermal Units (B.T.U.) multiply the value in kg-cal. by 3.9685. A positive value in the table indicates an evolution of heat during formation.

Name	Formula	Physical state	Heat of formation in kg.-calories
Aluminum bromide	Al, Br_3	solid	126.7
Aluminum carbide	Al_4, C_3	solid	60.
Aluminum chloride	Al, Cl_3	solid	166.8
Aluminum chloride	Al, Cl_3	dil. sol.	238.1
Aluminum fluoride	Al, F_3	dil. sol.	360.1
Aluminum hydroxide	Al, O_3, H_3	solid	304.9
Aluminum hydroxide	$Al_2O_3 \cdot 3H_2O$	solid	388.92
Aluminum iodide	Al, I_3	solid	77.2
Aluminum nitride	Al, N	solid	80.0
Aluminum oxide	Al_2, O_3	solid	380.0
Aluminum silicate	Al_2, Si_2, O_7	solid	767.5
Aluminum silicate	Al_2, Si_2, O_9, H_4	solid	927.42
Aluminum sulfate	Al_2, S_3, O_{12}	dil. sol.	879.7
Aluminum sulfide	Al_2, S_3	solid	344.8
Ammonia	N, H_3	gas	11.0
Ammonia	N, H_3	liq.	16.07
Ammonium acetate	N, H_7, C_2, O_2	solid	150.25
Ammonium acid carbonate	N, H_5, C, O_3	solid	208.6
Ammonium acid sulfate	N, H_5, S, O_4	solid	244.6
Ammonium acid sulfate	N, H_5, S, O_4	dil. sol.	245.1
Ammonium acid sulfide	N, H_5, S	solid	40.0
Ammonium acid sulfide	NH_3, H_2S	solid	22.4
Ammonium bromide	N, H_4, Br	solid	64.58
Ammonium bromide	NH_3, HBr	solid	45.0

HEATS OF FORMATION OF INORGANIC COMPOUNDS

Name	Formula	Physical state	Heat of formation in kg. calories

Potassium ferricyanide	K_3, Fe, 6CN	solid	263.3
Potassium ferrocyanide	K_4, Fe, C_6, N_6	solid	131.9
Potassium ferrocyanide	K_4, Fe, C_6, N_6	dil. sol.	119.5
Potassium ferrocyanide	K_4, Fe, 6CN	solid	358.9
Potassium fluoride	K, F	solid	134.51
Potassium fluoride	K, F	dil. sol.	138.4
Potassium fluosilicate	2KF, SiF_4	solid	52.8
Potassium fluosilicate	K_2, Si, F_6	dil. sol.	664.5
Potassium hydroxide	K, O, H	solid	102.01
Potassium hydroxide	K, O, H	dil. sol.	114.808
Potassium hydroxide	2K, O, H_2O = 2KOH	solid	2×68.99
Potassium hydroxide	2K, O, xH_2O = 2KOH + Aq.	dil. sol.	2×82.28
Potassium hypobromite	K, Br, O	dil. sol.	81.6
Potassium hypochlorite	K, Cl, O	dil. sol.	89.35
Potassium hyponitrite	K_2, N_2, O_2	dil. sol.	117.0

HEATS OF FORMATION OF INORGANIC COMPOUNDS

Name	Formula	Physical state	Heat of formation in kg. cal.
Potassium hypophosphite	K, H_2, P, O_2	dil. sol.	202.9
Potassium iodate	K, I, O_3	solid	121.70
Potassium iodate	K, I, O_3	dil. sol.	114.8
Potassium iodide	K, I	solid	78.87
Potassium iodide	K, I	dil. sol.	74.0
Potassium metasulfate	K_2, S_2, O_5	solid	361.1
Potassium nitrate	K, N, O_3	solid	118.093
Potassium nitrate	K, N, O_3	dil. sol.	110.
Potassium nitrite	K, N, O_2	dil. sol.	85.78
Potassium oxalate	K_2, C_2, O_4	solid	320.8
Potassium oxide	K_2, O	solid	86.26
Potassium oxide (tri)	K_2, O_3	solid	126.
Potassium pentathionate	K_2, S_5, O_6	solid	398.09
Potassium perchlorate	K, Cl, O_4	solid	112.71
Potassium periodate	K, I, O_4	dil. sol.	97.73
Potassium permanganate	K, Mn, O_4	solid	192.9
Potassium permanganate	K, Mn, O_4	dil. sol.	182.5
Potassium persulfate	K_2, S_2, O_8	solid	457.5
Potassium persulfate	K_2, S_2, O_8	dil. sol.	443.8
Potassium phosphate (ortho)	K_3, P, O_4	dil. sol.	478.4
Potassium phosphate (hydrogen)	K_2, H, P, O_4	dil. sol.	425.6
Potassium phosphate (dihydrogen)	K, H_2, P, O_4	solid	362.7
Potassium phosphate (dihydrogen)	K, H_2, P, O_4	dil. sol.	367.27
Potassium pyrosulfate	K_2, S_2, O_7	solid	475.4
Potassium pyrosulfate	K_2, S_2, O_7	dil. sol.	471.6
Potassium selenide	K_2, Se	solid	74.4
Potassium sulfate	K_2, S, O_4	solid	342.66
Potassium sulfate	K_2, S, O_4	dil. sol.	336.
Potassium sulfate	K_2, SO_2, O_2	solid	273.56
Potassium sulfide	K_2, S (rhomb)	solid	121.5
Potassium sulfide	K_2, S (rhomb)	dil. sol.	110.6
Potassium sulfite	K_2, S, O_3	solid	267.7
Potassium tetroxide	K_2, O_4	solid	135.
Potassium tetrasulfide	K_2, S_4	solid	114.1
Potassium tetrathionate	K_2, S_4, O_6	solid	406.0
Potassium thiocyanate	K, C, N, S	solid	47.40
Potassium thiosulfate	K_2, S_2, O_3	solid	270.5
Potassium thiosulfate	K_2, S_2, O_3	dil. sol.	261.65
Potassium tri-iodide	KI, I_2	solid	13.6
Potassium trithionate	K_2, S_3, O_6	solid	411.2
Praseodymium dioxide	Pr, O_2	solid	231.5
Praseodymium trichloride	Pr, Cl_3	solid	254.9
Praseodymium trioxide	Pr_2, O_3	solid	439.4
Rubidium acid carbonate	Rb, H, C, O_3	solid	230.44
Rubidium acid fluoride	RbF, HF	solid	22.58
Rubidium acid sulfate	Rb, H, S, O_4	solid	277.6
Rubidium bromide	Rb, Br	solid	95.83
Rubidium carbonate	Rb, C, O_3	solid	273.66
Rubidium carbonate	Rb_2O, CO_2	solid	97.42
Rubidium chloride	Rb, Cl	solid	105.08
Rubidium fluoride	Rb, F	solid	133.24
Rubidium hydroxide	Rb, O, H	solid	101.3
Rubidium hydroxide	$2Rb, O, H_2O = 2RbOH$	dil. sol.	2×82.4
Rubidium iodide	Rb, I	solid	81.03
Rubidium oxide	Rb_2, O	solid	82.9

HEATS OF FORMATION OF INORGANIC COMPOUNDS

Name	Formula	Physical state	Heat of formation in kg calories
Rubidium sulfate	Rb_2, S, O_4	solid	344.48
Rubidium sulfide	Rb_2, S	solid	87.7
Rubidium thiocyanate	Rb, C, N, S	solid	56.
Selenic acid	H_2, Se, O_4	liq.	126.6
Selenious acid	H_2, Se, O_3	solid	119.69
Selenium chloride	Se_2, Cl_2	liq.	22.15
Selenium hydroxide (ic)	Se, O_3, H_3	dil. sol.	79.3
Selenium hydroxide (ous)	Se, O_2, H_2	solid	52.4
Selenium nitride	Se, N	solid	−42.3
Selenium oxide (di)	Se, O_2	solid	56.36
Selenium tetrachloride	Se, Cl_4	solid	46.165
Silicic acid	H_4, Si, O_4	colloid.	334.3
Silicon bromide	Si, Br_4	liq.	93.6
Silicon carbide	Si, C	solid	28.
Silicon chloride	Si, Cl_4	gas	142.7
Silicon chloride	Si, Cl_4	liq.	150.1
Silicon fluoride	Si, F_4	gas	360.1
Silicon hydride	Si, H_4	gas	8.7
Silicon iodide	Si, I_4	solid	29.8
Silicon oxide	Si, O_2	solid	201.4
Silicon sulfide	Si, S_2	solid	32.02
Silver acetate	Ag, C_2, H_3, O_2	solid	96.8
Silver acid fluoride	AgF, HF	solid	2.0
Silver ammonia chloride	AgCl, $3NH_3$	solid	31.6
Silver bromide	AgBr	solid	23.85
Silver carbide	Ag, C	solid	−41.8
Silver carbonate	Ag_2, C, O_3	solid	119.9
Silver carbonate	Ag_2, CO_2, O	solid	25.96
Silver chlorate	Ag, Cl, O_3	solid	1.8
Silver chloride	Ag, Cl	solid	30.30
Silver chloride (sub)	AgCl, $Ag = Ag_2Cl$	solid	0.5
Silver cyanate	Ag, C, N, O	solid	23.66
Silver cyanide	Ag, C, N	solid	−33.45
Silver dithionate	Ag_2, S_2, $O_6 \cdot 2H_2O$	solid	231.06
Silver fluoride	Ag, F	solid	48.7
Silver fluoride	Ag, F	dil. sol.	53.0
Silver fluoride (sub)	AgF, $Ag = Ag_2F$	solid	−0.7
Silver fulminate	Ag, O, N, C	solid	−42.8
Silver hyponitrite	Ag_2, N_2, O_2	solid	−34.4
Silver iodide	Ag, I	cryst.	15.15
Silver iodide	Ag, I	ppt.	14.93
Silver nitrate	Ag, N, O_3	solid	29.4
Silver nitrate	Ag, N, O_3	dil. sol.	24.66
Silver nitride	Ag, N_3	solid	−67.3
Silver nitrite	Ag, N, O_2	solid	11.6
Silver oxalate	Ag_2, C_2, O_4	solid	159.6
Silver oxide	Ag_2, O	solid	6.953
Silver peroxide	Ag_2, O_2	solid	5.95
Silver potassium bromide	AgBr, KBr	solid	−0.4
Silver potassium cyanide	AgCN, KCN	solid	11.9
Silver potassium iodide	AgI, KI	solid	−1.8
Silver potassium iodide	AgI, 3KI	solid	−0.9
Silver selenide	Ag_2, Se	solid	0.96
Silver sulfate	Ag_2, S, O_4	solid	170.1
Silver sulfate	Ag_2, SO_2, O_2	solid	96.20

HEATS OF FORMATION OF INORGANIC COMPOUNDS

Name	Formula	Physical state	Heat of formation in kg. calories
Silver sulfide	Ag_2, S	solid	5.5
Silver thiocyanate	Ag, C, N, S	solid	−21.90
Sodium acetate	Na, C_2, H_3, O_2	solid	171.34
Sodium acid arsenate	Na, H_2, As, O_4	dil. sol.	273.7
Sodium acid arsenate	Na_2, H, As, O_4	dil. sol.	329.7
Sodium acid carbonate	Na, H, C, O_3	solid	226.4
Sodium acid carbonate	Na, H, C, O_3	dil. sol.	222.3
Sodium acid fluoride	Na, H, F_2	solid	216.75
Sodium acid fluoride	NaF, HF	solid	17.1
Sodium acid oxalate	Na, H, C_2, O_4	solid	257.7
Sodium acid phosphite	Na, H_2, P, O_3	dil. sol.	285.9
Sodium acid selenate	Na, H, Se, O_4	dil. sol.	201.84
Sodium acid selenide	Na, H, Se	dil. sol.	31.0
Sodium acid sulfate	Na, H, S, O_4	solid	269.04
Sodium acid sulfide	Na, H, S	solid	56.76
Sodium acid sulfide	Na, H, S	dil. sol.	61.3
Sodium acid sulfite	Na, H, S, O_3	dil. sol.	206.5
Sodium aluminate	Na, Al, O_2	solid	271.7
Sodium amide	Na, N, H_2	solid	32.0
Sodium antimonate	Na_3, Sb, O_4	solid	349.
Sodium antimonate	$3Na_2O$, Sb_2O_5	solid	2×81.85
Sodium arsenate	Na_3, As, O_4	solid	366.
Sodium arsenate	Na_3, As, O_4	dil. sol.	381.5
Sodium arsenite	Na_2, H, As, O_3	dil. sol.	271.7
Sodium bismuthate	Na_3, Bi, O_4	solid	284.
Sodium borate	$3Na_2O$, $B_2O_3 = 2Na_3BO_3$	solid	2×52.1
Sodium bromide	Na, Br(liq)	solid	86.73
Sodium bromide	Na, Br	dil. sol.	87.
Sodium bromide	Na, Br (gas)	solid	90.45
Sodium bromoplatinate	Na_2, Pt, Br_6	solid	221.3
Sodium bromoplatinate	2NaBr, Pt, Br_4	solid	46.79
Sodium carbide	Na_2, C_2 (diamond)	solid	−8.8
Sodium carbonate	Na_2, C, O_3	solid	269.89
Sodium carbonate	Na_2, C, O_3	dil. sol.	276.
Sodium carbonate	Na_2O, CO_2	solid	76.88
Sodium chlorate	Na, Cl, O_3	solid	83.60
Sodium chlorate	Na, Cl, O_3	dil. sol.	78.2
Sodium chloride	Na, Cl	solid	98.330
Sodium chloride	Na, Cl	dil. sol.	97.1
Sodium chloropalladite	Na_2, Pd, Cl_4	dil. sol.	242.3
Sodium chloroplatinate	Na_2, Pt, Cl_6	solid	272.1
Sodium chloroplatinate	Na_2, Pt, Cl_6	dil. sol.	280.29
Sodium chloroplatinate	2NaCl, Pt, Cl_4	solid	73.72
Sodium chloroplatinite	Na_2, Pt, Cl_4	solid	227.0
Sodium chromate	Na_2, Cr, O_4	solid	319.8
Sodium chromate	Na_2O, CrO_3	solid	77.0
Sodium cyanate	Na, C, N, O	solid	97.01
Sodium cyanate	Na, C, N, O	dil. sol.	92.23
Sodium cyanide	Na, C, N	solid	22.9
Sodium cyanide	Na, C, N	dil. sol.	22.5
Sodium dichromate	Na_2, Cr_2, O_7	dil. sol.	465.6
Sodium disulfide	Na_2, S_2	dil. sol	105.2
Sodium dithionate	Na_2, S_2, O_6	solid	401.0
Sodium fluoride	Na, F	solid	135.95
Sodium fluoride	Na, F	dil. sol.	135.70

HEATS OF FORMATION OF INORGANIC COMPOUNDS

Name	Formula	Physical state	Heat of formation in kg. calories
Sodium fluosilicate	Na_2, Si, F_6	solid	669.
Sodium fluosilicate	Na_2, Si, F_6	dil. sol.	658.31
Sodium formate	Na, C, H, O_2	solid	157.7
Soldium hydride	Na, H	solid	14.
Sodium hydroxide	Na, O, H	solid	101.96
Sodium hydroxide	Na, O, H	dil. sol.	112.
Sodium hydroxide	2Na, O, H_2O	solid	135.38
Sodium hypobromite	Na, Br, O	dil. sol.	78.8
Sodium hypochlorite	Na, Cl, O	dil. sol.	83.36
Sodium hypophosphite	Na_2, H, P, O_2	dil. sol.	198.4
Sodium iodide	Na, I	solid	69.28
Sodium iodide	Na, I	dil. sol.	70.8
Sodium iodide	Na, I (gas)	solid	76.50
Sodium iodoplatinate	Na_2, Pt, I_6	dil. sol.	167.0
Sodium manganate	Na_2, Mn, O_4	solid	270.0
Sodium manganate	Na_2O, Mn, O_3	solid	169.0
Sodium manganate	Na_2O, MnO_2, O	solid	49.4
Sodium metaborate	Na, B, O_2	dil. sol.	231.5
Sodium molybdate	Na_2, Mo, O_4	solid	364.
Sodium molybdate	Na_2O, MoO_3	solid	181.5
Sodium molybdate	Na_2O_2, MoO_2	solid	101.2
Sodium nitrate	Na, N, O_3	solid	111.72
Sodium nitrate	Na, N, O_3	dil. sol.	106.6
Sodium nitrite	Na, N, O_2	solid	86.5
Sodium nitrite	Na, N, O_2	dil. sol.	83.15
Sodium oxalate	Na_2, C_2, O_4	solid	314.7
Sodium oxalate	Na_2, C_2, O_4	dil. sol.	310.444
Sodium oxide	Na_2, O	solid	99.45
Sodium perchlorate	Na, Cl, O_4	solid	101.3
Sodium perchlorate	Na, Cl, O_4	dil. sol.	97.25
Sodium peroxide	Na_2, O_2	solid	119.2
Sodium phosphate (tri)	Na_3, P, O_4	solid	457.
Sodium phosphate (tri)	Na_3, P, O_4	dil. sol.	471.305
Sodium phosphate (di)	Na_2, H, P, O_4	solid	414.85
Sodium phosphate (mono)	Na, H_2, P, O_4	dil. sol.	364.6
Sodium phosphate (pyro)	Na_4, P_2, O_7	solid	755.08
Sodium phosphite	Na_2, H, P, O_3	dil. sol.	344.6
Sodium selenate	Na_2, Se, O_4	dil. sol.	261.3
Sodium selenate	Na_2O, Se, O_3	solid	154.1
Sodium selenate	Na_2O_2, SeO_2	solid	71.2
Sodium selenide	Na_2, Se	solid	59.1
Sodium selenite	Na_2, Se, O_3	dil. sol.	238.4
Sodium silicate	Na_2, Si, O_3	solid	371.2
Sodium stannate	Na_4, Sn, O_4	solid	370.1
Sodium stannate	Na_2O, Sn, O_2	solid	172.6
Sodium stannite	Na_2, Sn, O_2	dil. sol.	224.0
Sodium sulfate	Na_2, S, O_4	solid	330.48
Sodium sulfate	Na_2, S, O_4·10(H_2, O)	solid	1033.20
Sodium sulfide	Na_2, S	solid	89.8
Sodium sulfide	Na_2, S	dil. sol.	105.
Sodium sulfite	Na_2, S, O_3	solid	261.2
Sodium sulfite	Na_2, S, O_3	dil. sol.	264.
Sodium tetraborate	Na_2, B_4, O_7	solid	742.6
Sodium tetraborate (borax)	Na_2, B_4, O_7·10(H_2, O)	solid	1453.1
Sodium tetrasulfide	Na_2, S_4	solid	99.8

HEATS OF FORMATION OF INORGANIC COMPOUNDS

Name	Formula	Physical state	Heat of formation in kg. calories
Sodium tetrathionate	Na_2, S_4, O_6	dil. sol.	387.3
Sodium thiocyanate	Na, C, N, S	dil. sol.	40.36
Sodium thiosulfate	Na_2, S_2, O_3	solid	258.5
Sodium thiosulfate	$Na_2, S_2, O_3 \cdot 5(H_2, O)$	solid	613.
Sodium trisulfide	Na_2, S_3	dil. sol.	107.2
Sodium trithionate	Na_2, S_3, O_6	dil. sol.	392.
Sodium trithionate	$Na_2, S_3, O_6 \cdot 3(H_2, O)$	solid	606.7

HEATS OF FORMATION OF INORGANIC COMPOUNDS

Name	Formula	Physical state	Heat of formation in kg. calories
Thallium sulfide	Tl_2, S	solid	21.98
Thallium telluride	Tl_2, Te	solid	7.17
Thiocyanic acid	H, C, N, S	dil. sol.	−18.4
Thionic acid (di)	H_2, S_2, O_6	dil. sol.	274.31
Thionic acid (penta)	H_2, S_5, O_6	dil. sol.	267.62
Thionic acid (tetra)	H_2, S_4, O_6	dil. sol.	262.37
Thionic acid (tri)	H_2, S_3, O_6	dil. sol.	261.89
Thorium bromide	Th, Br_4	solid	281.0
Thorium bromide	Th, Br_4	dil. sol.	351.7
Thorium carbonate	Th, C_2, O_6	solid	855.2
Thorium chloride	Th, Cl_4	solid	335.0
Thorium chloride	Th, Cl_4	dil. sol.	392.12
Thorium hydride	Th, H_4	solid	−42.77
Thorium hydroxide	Th, O_4, H_4	ppt.	325.1
Thorium iodide	Th, I_4	dil. sol.	291.8
Thorium oxide	Th, O_2	solid	293.
Thorium oxybromide	Th, O, Br_2	solid	318.8
Thorium oxychloride	Th, O, Cl_2	solid	336.9
Thorium oxyiodide	Th, O, I_2	solid	289.6
Thorium sulfate	Th, S_2, O_8	dil. sol.	661.9
Tin bromide (ic)	Sn, Br_4	liq.	91.8
Tin bromide (ic)	Sn, Br_4	solid	94.8
Tin bromide (ic)	Sn, Br_4	dil. sol.	111.6
Tin bromide (ous)	Sn, Br_2	solid	61.41
Tin bromide (ous)	Sn, Br_2	dil. sol.	60.0
Tin chloride (ic)	Sn, Cl_4	liq.	127.4
Tin chloride (ic)	Sn, Cl_4	gas	118.3
Tin chloride (ous)	Sn, Cl_2	solid	81.15
Tin hydroxide (ous)	Sn, O_2, H_2	colloid.	136.4
Tin iodide (ous)	Sn, I_2	solid	38.9
Tin oxide (ic)	Sn, O_2	solid	138.1
Tin oxide (ous)	Sn, O	solid	67.7
Tin sulfide (ous)	Sn, S	solid	22.7
Titanium chloride	Ti, Cl_4	liq.	181.4
Titanium oxide	Ti, O_2	amorph.	215.6
Titanium oxide	Ti, O_2	cryst.	218.4
Tungsten dioxide	W, O_2	solid	130.5
Tungsten pentoxide	W_2, O_5	solid	324.
Tungsten trioxide	W, O_3	solid	195.7
Tungstic acid	H_2, W, O_4	solid	284.5
Tungstic acid	H_2, W, O_4	dil. sol.	284.4
Uranium carbide	U, C_2	solid	28.91
Uranium dioxide	U, O_2	solid	256.6
Uranium octoxide	U_3, O_8	solid	845.2
Uranium tetroxide	U, O_4·2(H_2, O)	solid	426.0
Uranium trioxide	U, O_3	solid	291.6
Uranyl acetate	U, O_2, C_4, H_6, O_4	dil. sol.	476.5
Uranyl acetate	U, O_2, C_4, H_6, O_4·2H_2O	solid	617.7
Uranyl chloride	U, O_2, Cl_2	dil. sol.	320.2
Uranyl chloride	U, O_2, Cl_2·H_2O	solid	382.3
Uranyl chromate	U, O_2, Cr, O_4	dil. sol.	444.9
Uranyl chromate	U, O_2, Cr, O_4·5½H_2O	solid	827.5
Uranyl nitrate	U, O_2, N_2, O_6	solid	322.1
Uranyl nitrate	U, O_2, N_2, O_6	dil. sol.	341.0
Uranyl sulfate	U, O_2, S, O_4	dil. sol.	455.0

HEATS OF FORMATION OF INORGANIC COMPOUNDS

Name	Formula	Physical state	Heat of formation in kg. calories
Uranyl sulfate	$U, O_2, S, O_4 \cdot 3(H_2, O)$	solid	655.6
Vanadium dichloride	V, Cl_2	solid	147.2
Vanadium dioxide	V_2, O_2	solid	195.
Vanadium pentoxide	V_2, O_5	solid	437.3
Vanadium tetrachloride	V, Cl_4	liq.	165.
Vanadium tetroxide	V_2, O_4	solid	383.
Vanadium trichloride	V, Cl_3	liq.	187.1
Vanadium trioxide	V_2, O_3	solid	330.
Vanadyl chloride	V, O, Cl_3	liq.	201.2
Zinc acetate	Zn, C_4, H_6, O_4	solid	261.17
Zinc acetate	$Zn, C_4, H_6, O_4 \cdot 2(H_2O)$	solid	403.59
Zinc bromide	Zn, Br_2	solid	78.4
Zinc bromide	Zn, Br_2	dil. sol.	92.95
Zinc carbonate	Zn, C, O_3	ppt.	194.2
Zinc chloride	Zn, Cl_2	solid	99.547
Zinc chloride	Zn, Cl_2	dil. sol.	115.27
Zinc cyanide	Zn, C_2, N_2	solid	−16.2
Zinc cyanide	$Zn, (CN)_2$	solid	53.4
Zinc dithionate	$Zn, S_2, O_6 \cdot 6(H_2, O)$	solid	723.5
Zinc dithionate	$Zn, 2SO_2, O_2 \cdot 6H_2, O$	solid	173.85
Zinc ethyl	Zn, C_4, H_{10}	liq.	10.0
Zinc fluoride	Zn, F_2	solid	144.0
Zinc fluoride	Zn, F_2	dil. sol.	192.31
Zinc formate	Zn, C_2, H_2, O_4	solid	231.3
Zinc hydroxide	Zn, O_2, H_2	solid	155.
Zinc hydroxide	ZnO, H_2O	solid	2.4
Zinc iodide	Zn, I_2	solid	49.70
Zinc iodide	Zn, I_2	dil. sol.	61.41
Zinc nitrate	Zn, N_2, O_6	dil. sol.	134.7
Zinc nitrate	$Zn, N_2O_4, O_2 \cdot 6H_2O$	solid	140.82
Zinc nitride	Zn, N_6	solid	−50.9
Zinc oxalate	$Zn, C_2, O_4 \cdot 2H_2O$	solid	373.2
Zinc oxide	Zn, O	solid	85.0
Zinc potassium sulfate	$ZnSO_4, K_2SO_4$	solid	4.145
Zinc selenide	Zn, Se	cryst.	29.6
Zinc selenide	Zn, Se	solid	33.45
Zinc selenide	Zn, Se	ppt.	30.3
Zinc silicate	Zn, Si, O_3	solid	282.6
Zinc silicate	ZnO, SiO_2	cryst.	23.74
Zinc silicate	$2ZnO, SiO_2$	glassy	2.49
Zinc sulfate	Zn, S, O_4	solid	233.4
Zinc sulfate	Zn, S, O_4	dil. sol.	252.
Zinc sulfate	Zn, SO_2, O_2	solid	158.99
Zinc sulfate	$Zn, S, O_4 \cdot 7(H_2,O)$	solid	734.8
Zinc sulfide	Zn, S	cryst.	44.0
Zinc sulfide	Zn, S	solid	45.88
Zinc sulfide	Zn, S	ppt.	44.3
Zinc sulfide	$Zn, S \cdot xH_2O$	solid	39.57
Zinc telluride	Zn, Te	cryst.	33.21
Zirconium carbide	Zr, C	solid	44.
Zirconium oxide	Zr, O_2	solid	258.1

FREE ENERGIES AND HEATS OF FORMATION OF COMPOUNDS

SURFACE TENSIONS OF VARIOUS LIQUIDS

The table below gives the surface tension of various liquids in dynes per centimeter. The nature of the gas in contact with the surface of the liquid is given in parenthesis following the name of the compound. The temperature in degrees centigrade is indicated by the superscript which accompanies the value in each case.

The value k_E (Eötvös constant) $= \frac{d\Gamma}{dt} = \frac{d(M/d)^{2/3}\gamma}{dt}$, where d is the density of the substance, M is the gram formula weight, t the temperature and γ is the surface tension in dynes per centimeter.

Name	Surface Tension in Dynes per Centimeter			k_E
Acetal (air)	$23.2^{25°}$	$21.65^{200°}$	$13.5^{100°}$	....
Acetaldehyde	$22.4^{10°}$	$21.2^{200°}$	$17.0^{50°}$	1.8

24	Na_2CrO_4 (30°)	$72.6^{0.51M}$	$77.3^{1.95M}$	$82.6^{3.31M}$
25	$NaNO_3$ (20°)	$72.87^{0.1M}$	$73.35^{0.5M}$	$73.95^{1.0M}$
26	NaOH (18°)	$74.4^{0.7M}$	$75.9^{1.5M}$	$83.1^{5.0M}$
27	$Na_2S_2O_3$ (40°)	$71.1^{0.49M}$	$72.4^{1.0M}$	$78.9^{3.04M}$
28	$SrCl_2$ (20°)	$72.93^{0.05M}$	$73.10^{0.1M}$	$73.57^{0.25M}$
29	$Zn(NO_3)_2$ (40°)	$71.1^{0.6M}$	$72.6^{1.1M}$	$77.4^{2.8M}$
30	$ZnSO_4$ (20°)	$73.25^{0.25M}$	$73.73^{0.5M}$	$74.71^{1.0M}$

FORMULAS RELATING SURFACE TENSION

In the following table, γ is the surface
temperature in degrees absolute; T_c is the

Benzene: γ (vapor) $= 71.926\left(1-\frac{T}{561.6}\right)^{1.23} \pm 0.2$, from 0°C. to T_c

p-Bromotoluene: γ (air) $= 66.46\left(1-\frac{T}{694}\right)^{1.2}$

Carbon dioxide: $\gamma = 75\left(1-\frac{T}{T_c}\right)^{1.25}$

Carbon tetrachloride: γ (vapor) $= 67.671\left(1-\frac{T}{556.25}\right)^{1.23} \pm 0.2$, from 10°C. to 270°C.

Chlorine: $\gamma = 72\left(1-\frac{T}{T_c}\right)^{1.18}$

p-Chloroaniline: γ (air) $= 81.37\left(1-\frac{T}{787}\right)^{1.2}$

Chlorobenzene: γ (vapor) $= 72.20\left(1-\frac{T}{632.3}\right)^{1.23} \pm 0.2$, from 10°C. to 333°C.

p-Chlorobromobenzene: γ (air) $= 71.83\left(1-\frac{T}{722}\right)^{1.2}$

p-Chloroiodobenzene: γ (air) $= 74.71\left(1-\frac{T}{767}\right)^{1.2}$

p-Chloronitrobenzene: γ (air) $= 78.68\left(1-\frac{T}{768}\right)^{1.2}$

p-Chlorotoluene: γ (air or vapor) $= 66.65\left(1-\frac{T}{653}\right)^{1.2}$

ORGANIC SOLUTIONS AGAINST AIR

script and are expressed in moles per kilogram of water. The temperature in degrees Centigrade is given in parenthesis after the formula.

AND TEMPERATURE OF VARIOUS SUBSTANCES

tension in dynes per centimeter; T is the critical temperature in degrees absolute.

p-Dichlorobenzene: γ (air) $= 71.45 \left(1 - \frac{T}{675}\right)^{1.2}$

Ethyl alcohol: $\gamma = 230.564 \left(1 - \frac{T}{516.2}\right)^{1.45} - 304.339 \left(1 - \frac{T}{516.2}\right)^{2} + 139.756 \left(1 - \frac{T}{516.2}\right)^{3} \pm 0.3$, from 10°C. to 240°C.

Ethyl ether: γ (vapor) $= 57.358 \left(1 - \frac{T}{466.9}\right)^{1.22} \pm 0.2$, from 20°C. to 193°C.

p-Iodotoluene: γ (air) $= 69.28 \left(1 - \frac{T}{734}\right)^{1.2}$

Methyl alcohol: $\gamma = 173.245 \left(1 - \frac{T}{513.1}\right)^{1.33} - 243.042 \left(1 - \frac{T}{513.1}\right)^{2} + 146.344 \left(1 - \frac{T}{513.1}\right)^{3} \pm 0.2$, from 70°C. to 235°C.

Methyl chloride: $\gamma = 72 \left(1 - \frac{T}{Tc}\right)^{1.22}$

Methyl formate: $\gamma = 77.83 \left(1 - \frac{T}{487.1}\right)^{1.23} \pm 0.2$, from 50°C. to 214°C.

p-Nitrotoluene: γ (air) $= 74.06 \left(1 - \frac{T}{754}\right)^{1.2}$

Nitrous oxide: $\gamma = 86 \left(1 - \frac{T}{Tc}\right)^{1.23}$

SURFACE TENSION OF AQUEOUS

The table below gives values for the surface tension of various organic aqueous solutions of different concentrations. The concentration is indicated directly below

	Formula	Surface Tension in Dynes per Centimeter		
1	Acetic acid (30°C)	67.98 1.000%	60.11 5.001%	54.56 10.01%
2	Acetone (25°C)	55.45 5%	48.94 10%	41.11 20%
3	*iso*-Amyl alcohol (15°C)	57.0 0.249%	49.3 0.5%	41.1 0.99%
4	*n*-Butyl alcohol (20°C)	72.8 0.0244%	72.4 0.0487%	67.2 0.1954%

INTERFACIAL TENSIONS

The table below gives values for the interfacial tensions (γ_t) in dynes per centimeter, between various compounds and either water or mercury. The temperature in degrees Centigrade is indicated in each case by a superscript.

Name	γ_t, dynes/cm
iso-Amyl alcohol—H_2O	$5.0^{18°}$
iso-Amyl butyrate—H_2O	$23.0^{20°}$
iso-Amyl chloride—H_2O	$15.44^{20°}$
Aniline—H_2O	$5.77^{20°}$
Aniline—Hg	$341^{20°}$
Anisole—H_2O	$25.82^{20°}$
Benzaldehyde—H_2O	$15.51^{20°}$
Benzene—H_2O	$35.00^{20°}$
Benzene—Hg	$357.2^{20°}$
Benzyl alcohol—H_2O	$4.75^{22.5°}$
Bromobenzene—H_2O	$39.82^{20°}$
o-Bromotoluene—H_2O	$41.15^{20°}$
iso-Butyl alcohol—H_2O	$2.1^{18°}$
iso-Butyl alcohol—Hg	$342.7^{20°}$
iso-Butyl chloride—H_2O	$24.43^{20°}$
tert.-Butyl chloride—H_2O	$23.75^{20°}$
Butyronitrile—H_2O	$10.38^{20°}$
Carbon disulfide—H_2O	$48.36^{20°}$
Carbon disulfide—Hg	$336^{20°}$
Carbon tetrachloride—H_2O	$45^{20°}$
Chlorobenzene—H_2O	$37.41^{20°}$
Chloroform—H_2O	$32.8^{20°}$
α-Chloronaphthalene—H_2O	$40.74^{20°}$
p-Cymene—H_2O	$34.61^{20°}$
Diethyl carbonate—H_2O	$12.86^{20°}$
Dipropylamine—H_2O	$1.66^{20°}$
Ethyl alcohol—Hg	$364^{20°}$
Ethyl bromide—H_2O	$31.20^{20°}$
Ethyl ether—H_2O	$10.7^{20°}$
Ethyl ether—Hg	$379^{20°}$
Ethyl mercaptan—H_2O	$26.12^{20°}$
Ethyl oleate—H_2O	$21.34^{20°}$
Ethyl propyl ketone—H_2O	$13.58^{20°}$
Ethylbenzene—H_2O	$31.35^{17.5°}$

Name	γ_i, dynes/cm
Ethylene bromide—H_2O	$36.54^{20°}$
Ethylene bromide—Hg	$326^{20°}$
n-Hexane—H_2O	$51.1^{20°}$
n-Hexane—Hg	$378^{20°}$
Iodobenzene—H_2O	$41.84^{20°}$
Mercury—H_2O	$375^{20°}$
Mesitylene—H_2O	$38.7^{20°}$
Methyl iodide—Hg	$304^{20°}$
Methylene chloride—H_2O	$28.31^{20°}$
Methylene chloride—Hg	$342.5^{20°}$
Nitrobenzene—H_2O	$25.66^{20°}$
Nitrobenzene—Hg	$350.5^{20°}$
Nitroethane—Hg	$378^{20°}$
Nitromethane—H_2O	$9.66^{20°}$
o-Nitrotoluene—H_2O	$27.19^{20°}$
n-Octane—H_2O	$50.8^{20°}$
n-Octane—Hg	$374.7^{20°}$
n-Octyl alcohol—H_2O	$8.5^{20°}$
sec.-Octyl alcohol—Hg	$359.0^{20°}$
Oleic acid—H_2O	$15.6^{20°}$
Oleic acid—Hg	$322^{20°}$
iso-Pentane—H_2O	$49.64^{20°}$
Phenetole—H_2O	$29.4^{20°}$
n-Propyl alcohol—Hg	$368^{20°}$
Styrene—H_2O	$35.48^{19°}$
Toluene—H_2O	$36.1^{25°}$
Toluene—Hg	$359^{20°}$
iso-Valeric acid—H_2O	$2.73^{20°}$
o-Xylene—H_2O	$36.06^{20°}$
p-Xylene—H_2O	$37.77^{20°}$
o-Xylene—Hg	$359^{20°}$
m-Xylene—Hg	$357^{20°}$
p-Xylene—Hg	$361^{20°}$

VISCOSITY

The viscosity of a substance is the shearing resistance of a liquid film which separates two horizontal plates, one of which is being moved across the other. The absolute viscosity of a substance is the force in dynes which will move one square centimeter of a plane surface with a speed of one centimeter per second relative to another parallel plane surface from which it is separated by a layer of the substance one centimeter thick. This may be expressed by the following formula:

$$\text{viscosity} = \frac{\text{force} \times \text{film thickness}}{\text{area of plate} \times \text{velocity}}.$$

The unit of absolute viscosity is the poise which is equal to one dyne second per square centimeter. That is, when two plates have a shearing area of 1 square centimeter and a film thickness of 1 centimeter, if a force of one dyne is required to maintain a velocity of 1 centimeter per second, the fluid is said to have a viscosity of 1 poise. Since the poise (η) is such a large unit it is generally more convenient to use the millipoise (1/1000 poise) or, in the case of gases, the micropoise (1/1,000,000 poise). Frequently the viscosity of a liquid is expressed in terms of specific viscosity, which is its absolute viscosity compared with that of water at the same temperature. If the temperature in question is 20°C. the specific viscosity equals the viscosity in centipoises (1/100 poise) since the viscosity of water at 20°C. is approximately 1 centipoise.

The kinematic viscosity of a substance is the ratio of the absolute viscosity to the density of the substance at the temperature of measurement. The unit of kinematic viscosity is the stoke and is equal to that possessed by a fluid which has a viscosity of one poise and a density of one gram per cubic centimeter.

Of special importance in the field of lubrication are the so-called kinematic viscosimeters which measure the time in seconds for a given volume of liquid to flow through a definite orifice at some specified temperature. See special table for conversion of kinematic viscosity in centistokes to Saybolt, Redwood, and Engler viscosimeter values.

VISCOSITY OF VARIOUS LIQUIDS

In the table below is given the viscosity of various liquids in millipoises (1000η) at the temperature in degrees Centigrade as indicated by the superscript.

Values in millipoises may be converted to centistokes by dividing by $10d^t$, where d^t is the density of the substance at the same temperature t.

VISCOSITY OF GASES AND VAPORS

In the table below is given the viscosity of various gases and vapors in micropoises ($\eta \times 10^6$) at the temperature in degrees Centigrade as indicated in each case by the superscript.

Name	$\eta \times 10^6$
Acetone	$72.5^{0°}$
	$78.0^{18°}$
	$94.27^{100°}$
	$125.7^{212.5°}$
Acetylene	$94.3^{0°}$
Air	$24^{-145°}$
	$87^{-98°}$
	$147^{-49.7°}$
	$170.9^{0°}$
	$175.9^{100°}$
	$180.8^{200°}$
	$185.6^{300°}$
	$190.4^{400°}$
	$195.1^{500°}$
	$199.7^{600°}$
	$208.8^{800°}$
	$217.5^{1000°}$
	$238.5^{1500°}$
	$258.2^{2000°}$
	$277.0^{2500°}$
	$294.6^{3000°}$
	$311.3^{3500°}$
	$327.7^{4000°}$

Name	$\eta \times 10^6$
Air	$343.3^{450°}$
	$358.3^{500°}$
Ammonia	$67.2^{-78.5°}$
	$92.6^{0°}$
	$108.0^{20°}$
	$130.3^{100°}$
Argon	$73.56^{-183.2°}$
	$138.0^{-104.4°}$
	$169.7^{-60.2°}$
	$210.4^{0°}$
	$216.8^{12.3°}$
	$221.0^{23°}$
	$270.2^{99.6°}$
	$323.1^{183°}$
Arsine	$145.8^{0°}$
	$198.1^{100°}$
Benzene	$70.9^{0°}$
	$75.9^{16.8°}$
	$100.7^{70.1°}$
	$117.6^{100°}$
	$124.7^{212.5°}$
Bromine	$151.1^{12.8°}$
	$170.5^{65.7°}$

VISCOSITY OF GASES AND VAPORS

Name	$\eta \times 10^6$
Bromine	$188.5^{99.7°}$
	$207.9^{139.7°}$
	$227.3^{179.7°}$

ABSOLUTE VISCOSITIES OF AQUEOUS GLYCEROL SOLUTIONS

M. L. Sheeley, *Ind. Eng. Chem. 24, 1060 (1932).*

Aqueous solutions of glycerol are suitable liquids for use as standards in calibrating technical viscosimeters. By means of an accurate specific gravity determination the percentage of glycerol concentration can be determined within ±0.02 per cent. (See special table of density of aqueous glycerol solutions.)

% Glycerol by Weight	Absolute Viscosity in Centipoises			% Glycerol by Weight	Absolute Viscosity in Centipoises

COEFFICIENTS OF COMPRESSIBILITY OF VARIOUS LIQUIDS AND AQUEOUS SOLUTIONS

In the table below are given values of β_t (the compressibility coefficient of a liquid at t°,.) to be used with the formula

$$\beta_t = \frac{1}{V_1}\left(\frac{V_1 - V_2}{P_2 - P_1}\right)$$

where V_1 is the volume of a liquid under a pressure of P_1 at t°C., and V_2 is the volume at some other pressure P_2, at the same temperature.

Liquid	t °C.	Pressure Range, atm.	βt $\times 10^6$

COEFFICIENTS OF CUBICAL EXPANSION FOR VARIOUS LIQUIDS AND AQUEOUS SOLUTIONS

See also the table *Coefficients of Cubical Expansion For Various Solids.*

In the table below are given the values of the coefficients a, b, and c in the equation $V_t = V_o (1 + at + bt^2 + ct^3)$. Where the compound is marked with * the basic volume is not that at 0°C, but at some other temperature, t_o. The equation then reads $V_t = V_{to}[1 + a(t - t_o) + b(t - t_o)^2 + c(t - t_o)^3]$. In the case of aqueous solutions, the concentrations in percent are given after the name.

Liquid	Coef. at 20°C. $\times 10^3$	Range °C.	$a \times 10^3$	$b \times 10^6$	$c \times 10^8$

WATER

To find the cubical expansion of water, substitute in the following formulas:

0° to 33°: $Vt = Vo(1 - 0.0_464268t + 0.0_5850526t^2 - 0.0_7678977t^3 + 0.0_9401209t^4$

0° to 80°: $Vt = Vo(1 - 0.0_453255t + 0.0_5761532t^2 - 0.0_7437217t^3 + 0.0_9164322t^4$

CUBICAL EXPANSION OF SOLIDS

The coefficient of cubical expansion is the increase in volume per unit volume per degree C. rise in temperature. For ordinary work the assumption may be made that the coefficient of cubical expansion is about three times the coefficient of linear expansion.

BAROMETRY AND BAROMETRIC CORRECTIONS

In principle, the mercurial barometer balances a column of pure mercury against the weight of the atmosphere. The height of the column above the level of the mercury in the reservoir can be measured and serves as a direct index of atmospheric pressure. The space above the mercury in a barometer tube should be a Torricellian vacuum, perfect except for the practically negligible vapor pressure of mercury. The perfection of the vacuum is indicated by the sharpness of the click noted when the barometer tube is inclined. A barometer should be in a vertical position, suspended rather than fastened to a wall, and in a good light but not exposed to direct sunlight or too near a source of heat. The standard conditions for barometric measurements are 0°C., and gravity as at 45° latitude and sea level. There are numerous sources of error but corrections for most of these are readily applied. Some of the corrections are very small and their application may be questionable in view of the probably larger errors. The degree of consistency to be expected in careful measurements is about 0.005 inch with a 0.25 inch tube, increasing to 0.0015 inch with a tube 0.5 inch in diameter.

In reading a barometer of the Fortin type (the usual laboratory instrument for precision measurements) the procedure should be as follows: (*1*) Observe and record the temperature as indicated by the thermometer attached to the barometer. The temperature correction is very important and may be affected by heat from the observer's body. (2) Set the mercury in the reservoir at zero level, so that the point of the pin above the mercury just touches the surface, making a barely noticeable dimple therein. Tap the tube at the top and verify the zero setting. (*3*) Bring the vernier down until the view at the light background is cut off at the highest point of the meniscus. Record the reading.

The corrections to be made on the reading are as follow: (*1*) Temperature, to correct for the difference in thermal expansion of the mercury and the brass (or glass) to which the scale is attached.—This correction converts the reading into the value at 0°C. The brass scale table is applicable to the Fortin barometer. See tables. (*2a*) Latitude-gravity correction, and (*2b*) altitude-gravity correction, to compensate for differences in gravity, which would affect the height of the mercury column by variation in mass.—If local gravity is unknown, an approximate correction may be made from the tables. Local values of gravity are often subject to irregularities which lead to errors even when the corrections here provided are made. It is, therefore, advisable to determine the local value of gravity, from which the correction can be effected in the following manner:

$$B_t = B_r + \left(\frac{g_1 - g_0}{g_0}\right) \times B_r$$

in which B_t and B_r are the true and the observed heights of the barometer respectively, g_0 is standard gravity (980,665 cm sec^{-2}), and g_1 is the local gravity. It may be noted that for most localities, g_1 is smaller than g_0, which makes the correction negative. These corrections compensate the reading to gravity at 45° latitude and sea level. (*3*) Correction for capillary depression of the level of the meniscus.—This varies with the tube diameter and actual height of the meniscus in a particular case. Some barometers are calibrated to allow for an average value of the latter and approximating the correction. See table. (*4*) Correction for vapor pressure of mercury.—This correction is usually negligible, being only 0.001 mm at 20°C. and 0.006 mm at 40°C. This correction is added. See table of vapor pressure of mercury.

All tables are given in both metric and English units. When a barometer reading is to be converted from one set of units to another, it is important that all corrections be made in the original units before the conversion is made.

The corrections above do not apply to an aneroid barometer. These instruments should be calibrated at regular intervals by checking them against a corrected mercurial barometer.

For records on weather maps, meteorologists customarily correct barometer readings to sea level, and some barometers may be calibrated accordingly. Such instruments are not suitable for laboratory use where true pressure under standard conditions is required. Scale corrections should be specified in the maker's instructions with the instrument, and are also indicated by the lack of correspondence between a gauge mark usually placed exactly 30 inches from the zero point and the 30 inch scale graduation.

DETERMINATION OF HEIGHTS BY THE BAROMETRIC FORMULA OF BABINET

$$Z = C\frac{B_0 - B}{B_0 + B}$$

$$\text{C (in feet)} = 52494\left(1 + \frac{t_0°F + t°F - 64}{900}\right)$$

$$\text{C (in meters)} = 16000\left(1 + \frac{2(t_0°\text{C} + t°C)}{1000}\right)$$

Z = difference in height of two stations.

B_0, B = barometric readings at the lower and upper stations respectively.

t_0, t = temperature of the air at the lower and upper stations respectively.

BAROMETER TEMPERATURE CORRECTION—GLASS SCALE METRIC UNITS

The values in the table below are to be subtracted from the observed readings to correct for the difference in the expansion of the mercury and the glass scale at different temperatures.

BAROMETRIC TEMPERATURE CORREC-

The table below gives corrections for the expansion of the mercury and of the brass scale in a barometer. The zero correction for the mercury is at 32°F., and for the brass scale at 62°F. The zero correction for the barometer is at 28.5°F. Add or

TION—BRASS SCALE—ENGLISH UNITS

subtract the correction as indicated by its sign. On a metric scale barometer the zero correction is at 0°C. (32°F.); because of this difference, readings taken in inches which are to be converted to readings in centimeters should first be corrected for temperature.

BAROMETRIC CORRECTION FOR GRAVITY

The values in the table below are to be subtracted from the readings taken on a mercurial barometer to correct for the decrease in gravity with increase in altitude.

Metric Units

Height above sea-level	Observed barometer height in millimeters								
	400	450	500	550	600	650	700	750	800

VALUES OF GRAVITY AT VARIOUS STATIONS

The following table gives values for the latitude, longitude, altitude and gravity of various places. Gravity is assumed to be the resultant acceleration caused by the attraction of gravity and the rotation of the earth. The values marked * have been corrected for the effect of topography and of isostatic compensation. All values are based on the Potsdam system.

Station	Latitude ° ′	Longitude ° ′	Altitude, meters	Gravity, cm/sec²
AFRICA				
Abu Hamed, Egypt	19° 32.0′	33° 19.9′E.	339	978.538
Algiers	36 44.8	3 3 E.	213	979.905

REDUCTION OF THE BAROMETER TO SEA LEVEL

A barometer located at an elevation above sea level will show a reading lower than a barometer at sea level by an amount approximately 2.5 millimeters (0.1 inch) for each 30.5 meters (100 feet) of elevation. A closer approximation can be made by reference to the following tables which take into account, (1) the effect of altitude of the station at which the barometer is read, (2) the mean temperature of the air column extending from the station down to sea level, (3) the latitude of the station at which the barometer is read and, (4) the reading of the barometer corrected for its temperature, a correction which is applied only to mercurial barometers since the aneroid barometers are compensated for temperature effects.

Example.—A barometer which has been corrected for its temperature read 650 mm. at a station whose altitude is 1350 meters above sea level and at a latitude of 30°. The mean temperature (outdoor temperature) at the station is 20°C.

Table A (metric units) gives for these conditions a temperature-altitude factor of 135.2
The Latitude Factor Table gives for 135.2 at 30° lat. a correction of ..... +0.17
Therefore, the corrected value of the temperature-altitude factor is 135.37

Entering Table B (metric units), with a temperature-altitude factor of 135.37 and a barometric reading of 650 mm. (corrected for temperature), the correction is found to be 109.6
Accordingly the barometric reading reduced to sea level is 650 + 109.6 = 759.6 mm.

LATITUDE FACTOR—ENGLISH OR METRIC UNITS

For latitudes 0°-45° add the latitude factor, for 45°-90° subtract the latitude factor, from the values obtained in Table A.

Temp.—Alt. Factor From Table A	Latitude				
	0°	10°	20°	30°	45°
50	0.1	0.1	0.1	0.1	0.0
100	0.3	0.3	0.2	0.1	0.0
150	0.4	0.4	0.3	0.2	0.0
200	0.5	0.5	0.4	0.3	0.0
250	0.7	0.6	0.5	0.3	0.0
300	0.8	0.8	0.6	0.4	0.0
350	0.9	0.9	0.7	0.5	0.0
	90°	80°	70°	60°	45°

SYMBOLS OF THERMODYNAMICAL AND PHYSICO-CHEMICAL QUANTITIES AND CONVENTIONS RELATING TO THEIR USE

Chem. and Ind., 56, 951 (1937).

The name of any quantity for which a given symbol is a second preference is printed in parentheses.

A	free energy—Helmholz; atomic weight; surface area.
A.	Angstrom unit.
a	activity; (acceleration).
a.	ampere, in sub-units *
B	magnetic induction.
C	concentration; electrostatic capacity. *with subscript:* molecular heat capacity.
C.	Centigrade.
c	velocity of light *in vacuo.*
c	velocity; concentration. *with subscript:* specific heat.
D	diffusion coefficient.
d	diameter; distance; (density).
d	differential.
∂	partial differential.
E	energy; (intrinsic energy); potential difference, especially electromotive force of voltaic cells. *with subscript:* single electrode potential.
e	electronic charge—charge equal and opposite in sign to that of an electron.
e	quantity of electricity, especially electrostatic charge. *with subscript:* single electrode potential.
e	base of natural logarithms.
F	Faraday's constant.
F	force; (free energy—Helmholz).
F.	farad; Fahrenheit.
f	acceleration; activity coefficient, for molar concentration; partition function.
f	function.
G	thermodynamic potential, Gibbs function, free energy —G. N. Lewis.
g	acceleration due to gravity, standard value.
g	acceleration due to gravity, as a variable; osmotic coefficient.
g.	gram.
H	enthalpy, total heat, heat content; magnetic field strength.
H.	henry.
h	Planck's constant.
h	height.
I	moment of inertia; ionic strength; electric current; intensity of light.
i	vapor pressure constant; van't Hoff's factor.
J	mechanical equivalent of heat.
J	gram-equivalent weight.
K	chemical equilibrium constant; (compressibility). K_s solubility product.
K.	Kelvin.
k	Boltzmann's constant.
k	thermal conductivity; velocity constant of chemical reaction.
L	latent heat per mol; self-inductance; (solubility product).
l	latent heat per g.; length; mean free path of molecules. *with subscript:* equivalent ionic conductance, "mobility."
l.	liter.
M	molecular weight; mutual inductance; magnetic moment.
M.	molar concentration.
m	rest mass of an electron.
m	mass.
m.	meter.

* *E.g.*, "ma." for "milliampere"; but "amp." is preferred for "ampere."

SYMBOLS OF THERMODYNAMICAL AND PHYSICO-CHEMICAL QUANTITIES AND CONVENTIONS RELATING TO THEIR USE

N	Avogadro's number.
N	mol fraction.
N.	normal concentration.
n	number of mols. *with subscript:* (transport number). *with subscript:* refractive index.
P	pressure.
$[P]$	parachor.
p	pressure.
Q	quantity of electricity.
q	heat entering a system.
R	gas constant per mol; Rydberg's constant.
R	electrical resistance.
$[R]$	*with subscript:* molecular refraction.
r	radius; (specific resistance). *with subscript:* specific refraction.
r.	Röntgen unit.
S	entropy.
s	solubility; (surface area).
T	temperature, on absolute Kelvin scale. *with subscript:* transport number.
t	time; (temperature—not on absolute scale).
U	intrinsic energy.
u	velocity component. *with subscript:* velocity of ions.
V	volume; potential, potential difference, including Volta potential.
v.	volt.
v	volume; velocity; velocity component.
W	(work done by or on a system).
w.	watt.
w	work done by or on a system; velocity component.
X	force component; potential gradient in electric field.
x	mol fraction.
Y	force component.
Z	force component; g.-equivalent weight; number of molecular collisions per second; atomic number.
z	valency of an ion.
α	degree of electrolytic dissociation; angle of optical rotation.
$[\alpha]$	specific optical rotation.
Γ	surface concentration excess.
γ	ratio of specific heats; surface tension.
Δ	increment.
δ	very small increment.
ϵ	dielectric constant; molar extinction coefficient.
ζ	electrokinetic potential.
η	efficiency of any process; viscosity; electrolytic polarization, overvoltage.
θ	angle of contact; temperature—not on absolute scale.
κ	compressibility; specific conductance; magnetic susceptibility—volume.
Λ	equivalent conductance.
λ	wave-length.
μ	chemical potential; dipole moment; magnetic permeability. *with subscript:* (refractive index).
μ.	micron.
ν	frequency; wave-number.
Π	pressure, especially osmotic pressure.
Π	product.
π	(electrolytic polarization, overvoltage).
π	ratio of circumference to diameter.
ρ	density; specific resistance.
Σ	sum.
σ	diameter of molecules; (surface tension); (specific conductance).

SYMBOLS OF THERMODYNAMICAL AND PHYSICO-CHEMICAL QUANTITIES AND CONVENTIONS RELATING TO THEIR USE

τ	time interval, especially half or mean life.	χ	magnetic susceptibility—mass.
ϕ	fluidity; electronic exit work function; magnetic flux.	ψ	wave function.
Φ	function.	Ω.	ohm.
		ω	angular velocity; specific magnetic rotation.

Note: The following distinctive letters have not been used in the lists above:

Italic capital: *O*. Greek capitals: Θ, Ξ, Υ, Φ, Ψ.
Lower case italic: *b*, *j*, *o*, *y*. Lower case Greek: β, ξ.

PREFIXES

The following prefixes to abbreviations for the names of units should be used to indicate the specified multiples or sub-multiples of these units:

M	mega-	$10^{6}\times$	c	centi-	$10^{-2}\times$
k	kilo-	$10^{3}\times$	m	milli-	$10^{-3}\times$
d	deci-	$10^{-1}\times$	μ	micro-	$10^{-6}\times$

e.g., MΩ. denotes megohm; kw., kilowatt; and μg., microgram. The use of $\mu\mu$. instead of mμ. to denote 10^{-7} cm., or of γ to denote microgram, is deprecated.

SUBSCRIPTS AND OTHER MODIFYING SIGNS

I, II . . .	*especially with symbols for thermodynamic functions*, referring to different systems or different states of a system.
1, 2 . . .	
A, B . . .	referring to molecular species A, B, etc.
i	referring to a typical ionic species i.
u	referring to an undissociated molecule.
+, −	referring to a positive or negative ion, or to a positive or negative electrode.
p, *v*, *T*	indicating constant pressure, volume, and temperature, respectively.
q	indicating adiabatic conditions.
w	indicating that no work is performed.
p, *c*, *a*	*with symbol for an equilibrium constant*, indicating that it is expressed in terms of pressure, concentration, or activity.
G, V, L, X	referring to gas, vapor, liquid, and crystalline states, respectively.
f, e, s, t, d	referring to fusion, evaporation (vaporization of liquid), sublimation, transition, and dissolution or dilution, respectively.
c	referring to the critical state or indicating a critical value.
0	referring to a standard state, or indicating limiting value at infinite dilution.
C, D, F	*with symbols for optical properties*, referring to a particular wave-length.

SYMBOLS OF THERMODYNAMICAL AND PHYSICO-CHEMICAL QUANTITIES AND CONVENTIONS RELATING TO THEIR USE

Where a symbol has to be added to a symbol which already carries a subscript, the two subscripts may be separated by a comma or the symbol with the first subscript may be enclosed in parentheses with the second subscript outside.

°	*as right-hand superscript to symbol*, referring to a standard state.
[ ]	*enclosing formula of chemical substance*, indicating its molar concentration.
{ }	*enclosing formula of chemical substance*, indicating its molar activity.

In crystallography it is recommended that:
Millerian indices be enclosed in parentheses, ( );
Laue indices be unenclosed;
Indices of a plane family be enclosed in braces, { };
Indices of a zone axis or line be enclosed in brackets, [ ].

Numerals attached to a symbol for a chemical element in various positions have the following meanings:

upper left	mass number of atom.
lower left	nuclear charge of atom.
lower right	number of atoms in molecule.

e.g., ${}^{7}_{3}\mathrm{Li}$; ${}^{2}_{1}\mathrm{H}_2$ (= D_2).

COMMON PHYSICAL CHEMISTRY EQUATIONS

By Frank Hovorka, Ph. D.

Gases

1. Molecular weight, volume, and temperature.

Perfect Gas Law: $PV = \frac{W}{M}RT$

Van der Waals' Equation: $\left[P + \frac{a}{V^2}\left(\frac{W}{M}\right)^2\right]\left[V - b\frac{W}{M}\right] = \frac{W}{M}RT$

Berthelot's Equation: $PV = \frac{W}{M}RT\left[1 + \frac{9}{128}\frac{P}{Pc}\frac{Tc}{T}\left(1 - 6\frac{Tc^2}{T^2}\right)\right]$

R is a constant independent of the nature of the gas and must be expressed in the same units as the pressure and the volume. It has the following values:

$R = 0.08205$ liter-atmospheres per degree per mole
82.05 cc-atmospheres per degree per mole
8.315 joules per degree per mole
1.986 calories per degree per mole
8.315×10^7 ergs per degree per mole

P, V, T, M, and W are the pressure, volume, absolute temperature, molecular weight, and the mass of the gas respectively. Pc and Tc are the critical pressure and the critical absolute temperature; a and b are individual constants that must be determined empirically for each substance. (See critical temperature and volume.) When V is in cubic centimeters then b must be expressed in cubic centimeters per molecular weight. When P is in atmospheres a must be in cc^2-atmospheres per molecular weight.

2. Critical temperature, pressure, and volume.

$$Pc = \frac{a}{3Vc^2} \qquad Tc = \frac{8PcVc}{3R}$$

$$Vc^3 = \frac{ab}{Pc} \qquad a = 3PcVc^2 \qquad b = \frac{Vc}{3}$$

Vc is the critical volume. For explanation of the other terms see part (1).

3. Effusion of Gases. $c = \sqrt{\frac{3PV}{mn}} = \sqrt{\frac{3RT}{mn}} = \sqrt{\frac{3RT}{d}}$

c is the root mean square velocity; m is the mass of each molecule; n is the number of molecules in a volume V at the pressure P or at the temperature T. When c is in centimeters per second, m is expressed in grams, V in cubic centimeters, P in dynes per square centimeter and R in ergs; d is the density.

COMMON PHYSICAL CHEMISTRY EQUATIONS

Graham's Law: $\frac{c_1}{c_2} = \sqrt{\frac{d_2}{d_1}} = \sqrt{\frac{M_2}{M_1}}$

c_1 and c_2, d_1 and d_2, M_1 and M_2 are the root mean square velocities, densities, and molecular weights of the two gases under consideration.

$$\frac{t_1}{t_2} = \frac{c_2}{c_1} = \sqrt{\frac{M_1}{M_2}}$$

t_1 and t_2 are the times of passage of each gas under a given pressure through an orifice. For an explanation of the other terms in the equation see the preceding equation.

$$\bar{n} = n\sqrt{\frac{RT}{2\pi M}}$$

$\bar{n}$ is the number of molecules striking a surface per square centimeter per second; n is the total number of molecules per cubic centimeter; M is the molecular weight; T is the absolute temperature; R is expressed in ergs per degree and is equal to 8.315×10^7 ergs.

4. Dissociation. $\alpha = \frac{d_1 - d_2}{d_2(n-1)} = \frac{M_1 - M_2}{M_2(n-1)} = \frac{V_2 - V_1}{V_1(n-1)}$

d_1, M_1, and V_1 are respectively the density, the molecular weight, and the volume of the undissociated gas; d_2, M_2, and V_2 are respectively the density, the apparent molecular weight, and the volume of the dissociated gas at the same temperature; α is the degree of dissociation, and n is the number of particles into which a molecule dissociates.

5. Adsorption.

Freundlich's Isotherm: $\log \frac{x}{m} = k + \frac{1}{n} \log P$

x is the mass of the gas absorbed; m is the mass of the absorbent; k and n are experimentally determined constants; P is the pressure of the gas.

Langmuir's Equation: $\frac{P}{x} = a + bP$

x is the number of gram molecules adsorbed per square centimeter at a pressure P; a and b are experimentally determined constants.

Liquids

1. Viscosity. $\frac{n_1}{n_2} = \frac{d_1 t_1}{d_2 t_2}$

n_1 and n_2, d_1 and d_2, t_1 and t_2 are respectively the absolute viscosities, densities, and times of flow in seconds of the two liquids through the same capillary at the same temperature and pressure; $\frac{n_1}{n_2}$ is the relative viscosity where n_2 usually refers to water.

COMMON PHYSICAL CHEMISTRY EQUATIONS

2. Surface tension. $\gamma = \frac{1}{2}hdgr$

γ is the surface tension in dynes per centimeter, h is the height in centimeters to which a liquid of the density d rises in a capillary of the radius r (in centimeters); g is the gravitational constant expressed in centimeters per sec.[2]

Molecular Surface Energy: $\gamma\left(\frac{M}{d}\right)^{2/3} = k(t_c - t - 6)$

M, d, and t_c are respectively the molecular weight, density, and the critical temperature of the liquid; t is the experimental temperature; k is the constant (Eötvos constant) equal to 2.12 for unassociated liquids.

Molecular Weight: $M = \left[\frac{k(t_2 - t_1)}{\gamma_1 d_1^{-2/3} - \gamma_2 d_2^{-2/3}}\right]^{3/2}$

γ_1 and γ_2, d_1 and d_2 are respectively the surface tensions and densities of a liquid at the temperature t_1 and t_2 respectively.

Eötvos Constant: $k = \frac{\gamma_1\left(\frac{M}{d_1}\right)^{2/3} - \gamma_2\left(\frac{M}{d_2}\right)^{2/3}}{t_2 - t_1}$

For explanation of the terms in this equation see equations on molecular surface energy and molecular weight.

Association: $x = \left(\frac{2.12}{k}\right)^{3/2}$

x is the degree of association.

Gibbs Adsorption Equation: $\mu = -\frac{C}{RT} \times \frac{d\gamma}{dC}$

μ is the excess of solute per unit surface or interface; C is the concentration of the solute, and $\frac{d\gamma}{dC}$ is the rate at which surface tension changes with concentration.

Sugden's Parachor: $P = \frac{m}{D - d} \times \gamma^{1/4}$

P is the parachor of the liquid under consideration, m is its molecular weight, D its density, γ its surface tension, and d the density of its saturated vapor (d may be neglected at low pressures).

3. Boiling Point and the Heat of Vaporization.

The Law of Ramsay and Young: $\frac{T_A}{T_B} = \frac{T_{A1}}{T_{B1}} + C(T_{A1} - T_A)$

T_A and T_B are the absolute boiling points of the substances A and B under the same pressure. T_{A1} and T_{B1} are the corresponding boiling points under another pressure. C is a constant. This relation holds very closely for related substances for which C is practically zero.

COMMON PHYSICAL CHEMISTRY EQUATIONS

Heat of Vaporization. *Trouton's Rule*: $\frac{\Delta H}{T} = 21$

Nernst-Bingham Rule: $\frac{\Delta H}{T} = 17 + 0.011T$

ΔH is the heat of vaporization per molecular weight and T its absolute boiling point under one atmosphere of pressure.

Both rules hold quite well for non-associated liquids.

4. Index of Refraction.

Lorenz and Lorentz Equation: $\frac{n^2 - 1}{n^2 + 2} \times \frac{1}{d} = r$

n is the index of refraction, d the density, and r the specific refraction.

Solutions

1. Vapor Pressure. Raoult's Law: $P = P_0 X_0$

P is the vapor pressure of the solvent or volatile solute over its solution; X_0 is the mole fraction and P_0 is the vapor pressure of the pure solvent or the volatile solute at the same temperature as the solution.

2. Molecular Weight of Solutes.

Rise of Boiling Point: $M = 1000 K_b \frac{g}{G \Delta T_b}$

Lowering of the Freezing Point: $M = 1000 K_f \frac{g}{G \Delta T_f}$

Lowering of the Vapor Pressure: $M = \frac{gm}{G} \times \frac{P}{P_0 - P}$

M is the molecular weight of the solute, g is the mass of the solute and G is the weight of the solvent. K_b and K_f are the molal boiling point and molal freezing point constants. T_b and T_f are the experimental boiling point raising and freezing point lowering respectively. m is the molecular weight of the solvent, P_0 is the vapor pressure of pure solvent and P is the vapor pressure of the solvent from its solution at the same temperature.

3. Conductivity.

Resistance: $R = \frac{E}{I}$

R is the resistance in ohms, E the voltage and I the amperage.

Conductance: $L = \frac{1}{R}$

L is the conductivity in reciprocal ohms; R is the resistance in ohms.

COMMON PHYSICAL CHEMISTRY EQUATIONS

Specific Conductivity: $\overline{L} = \frac{l}{A} \times L$

$\overline{L}$ is the specific conductivity, l is the distance between the electrodes, A the area of the electrodes, and L is the conductivity in reciprocal ohms.

Cell Constant: $K = \frac{A}{l}$

K is the cell constant; l is the distance between the electrodes and A the area of the electrodes.

Equivalent Conductivity: $\Lambda = \frac{1000\overline{L}}{C}$

Λ is the equivalent conductivity, $\overline{L}$ is the specific conductivity, and C is the normality of the solute.

Thermodynamics

1. First Law of Thermodynamics: $\Delta E = q - W$

ΔE is the change of internal energy of a system, q is the heat absorbed by the system, and W is the work done by the system against the surroundings.

Work Done by an Ideal Gas During Expansion:

(1) Against constant external pressure: $W = P(V_2 - V_1)$

(2) Against variable external pressure:

$$W = RT \ln \frac{V_2}{V_1} = RT \ln \frac{P_1}{P_2}$$

W is the work done, and P is the external pressure. P_1, V_1, P_2, V_2 are the initial and final pressures and volumes. If P is expressed in atmospheres and V is expressed in cubic centimeters, then W is in cc-atmospheres. One calorie is equal to 41.3 cc-atmospheres. When R is in calories then the term W (in 2) is in calories regardless of the units of V or P.

2. Effect of Temperature on Equilibrium.

In all of the following equations ΔH is positive when heat is absorbed.

Clapeyron Equation: $\frac{dP}{dT} = \frac{\Delta H}{T(V_2 - V_1)}$

$\frac{dP}{dT}$ is the rate of change of vapor pressure of a pure substance with temperature. V_1 and V_2 are the initial and final volumes. ΔH is the amount of heat absorbed by the substance undergoing a change of phase. T is the absolute equilibrium temperature of the two phases. When P is in atmospheres and V in cubic centimeters, ΔH must be in cc-atmospheres. (One calorie = 41.3 cc-atmospheres.) Likewise when V_1 refers to one gram of a substance, V_2 and ΔH also must refer to one gram.

COMMON PHYSICAL CHEMISTRY EQUATIONS

Clausius-Clapeyron Equation: The following equation is applicable to vaporization and sublimation only: $$\ln \frac{P_1}{P_2} = \frac{\Delta H}{R}\left(\frac{1}{T_2} - \frac{1}{T_1}\right)$$

P_1 and P_2 are the vapor pressures at absolute temperatures T_1 and T_2 respectively. ΔH is the molecular heat of vaporization or sublimation. If R is in calories, ΔH will be in calories regardless of the units of pressure.

$$\ln \frac{C_1}{C_2} = \frac{\Delta H}{R}\left(\frac{1}{T_2} - \frac{1}{T_1}\right)$$

C_1 and C_2 are the solubilities of a substance (in any units) at the absolute temperature T_1 and T_2. ΔH is the molecular heat of solution. When R is expressed in calories, then ΔH must be expressed in calories.

Van't Hoff's Isochore: $$\ln \frac{K_{c1}}{K_{c2}} = \frac{\Delta H}{R}\left(\frac{1}{T_2} - \frac{1}{T_1}\right)$$

$$\ln \frac{K_{p1}}{K_{p2}} = \frac{\Delta H}{R}\left(\frac{1}{T_2} - \frac{1}{T_1}\right)$$

All K_c and K_p values are obtained by placing the products in the numerator and the reactants in the denominator. K_{c1} and K_{p1} are the equilibrium constants at absolute temperature T_1; K_{c2} and K_{p2} are the equilibrium constants at absolute temperature T_2. ΔH is the heat of reaction for that reaction on which K_c and K_p are based. When R is in calories ΔH must also be in calories.

Free Energy and Equilibrium Constant: $\Delta F^0 = -RT \ln K_p$

ΔF^0 is equal to the change in free energy for a reaction in which the reactants are in their standard states (1 atmosphere) and are converted into products at 1 atmosphere.

Nernst Heat Theorem: $$\log K_p = -\frac{\Delta H}{4.58T} + \Sigma n(1.75 \log T) + \Sigma(nc)$$

ΔH is the heat of reaction at the absolute temperature T. Σn is equal to the number of moles of gaseous products minus the number of moles of gaseous reactants. $\Sigma(nc)$ is the sum of the Nernst constants; it is equal to the sum of individual constants (each constant must be multiplied by the number of moles of that substance) for gaseous products minus the sum of constants for gaseous reactants. For the values of Nernst constants see Taylor, *Treatise on Physical Chemistry*, p 586 (1931). In cases where the constant has not been determined for a particular substance, 3 to 3.2 may be used as a fair approximation.

Rates of Reaction

1. Unimolecular Reaction: $$k = \frac{1}{t}\ln\left(\frac{a}{a-x}\right)$$

$$t_{1/2} = \frac{0.693}{k}$$

k is the velocity constant, a is the initial concentration, $(a - x)$ is the concentration remaining after the time t, x is the amount reacting in the time t, and $t_{½}$ is the period of half life of a unimolecular reaction.

2. Bimolecular Reaction.

(1) When equimolecular quantities (a and b) of the initial substance are used:

$$k = \frac{1}{t} \times \frac{x}{a(a-x)}$$

(2) When other than equimolecular quantities of the initial substances are used:

$$k = \frac{1}{t(a-b)} \ln \frac{b(a-x)}{a(b-x)}$$

3. Influence of Temperature on the Rate of Reaction.

Arrhenius Equations:

$$\frac{d \ln k}{dt} = \frac{E}{RT^2}$$

$$\ln \frac{k_1}{k_2} = \frac{E}{R}\left(\frac{1}{T_2} - \frac{1}{T_1}\right)$$

E represents the energy of activation per gram mole of a substance; k_1 and k_2 are the specific reaction rates at absolute temperatures T_1 and T_2 respectively; R is the gas constant.

Electromotive Force

1. Variation with Temperature: $E = T\left(\frac{dE}{dT}\right) - \frac{\Delta H}{nF}$

E is the electromotive force of a system; n is the change in valence of the ion causing the potential difference; F is equal to the charge carried by gram ion or is equal to 23,060 calories; $\frac{dE}{dT}$ is the rate of change of electromotive force with temperature; T is the experimental absolute temperature; ΔH is the heat of reaction.

2. Concentration Cell.

(1) *Without transference*: $E = \frac{RT}{nF} \ln \frac{C_1}{C_2}$

(2) *With transference*: $E = \left(\frac{2\mu}{\mu + v}\right)\frac{RT}{nF} \ln \frac{C_1}{C_2}$

μ and v are the velocities of the positive and negative ions respectively; C_1 and C_2 are the concentrations (in any units); the velocity of the faster ion is inserted in the numerator. See part 1 for the explanation of the other terms.

DEFINITIONS OF CHEMICAL AND PHYSICAL TERMS

Absolute Zero—The beginning or zero point in the absolute (thermodynamic) temperature scale. According to the kinetic theory of heat, it represents the temperature at which all thermal motion ceases. It is equal to −273.18°C. or −459.72°F.

Absorption, Heat of—The heat evolved when a given amount of a substance is absorbed.

Acetyl Number (value)—A number or value which indicates the extent to which a substance may be acetylated. In the analysis of fats, oils, etc., it is taken as the measure of the amount of hydroxy acids and higher alcohols which are present since other substances ordinarily present are not affected by the acetylating agent. It is expressed in milligrams of potassium hydroxide required to neutralize the acetic acid liberated from one gram of acetylated fat or oil.

Acetylene—Any open chain hydrocarbon containing one or more triple bonds; specifically the hydrocarbon CH:CH, in distinction from diacetylene, triacetylene, etc., with two, or three, etc., respectively, triple bonds.

Acid—Any chemical compound containing hydrogen capable of being replaced by positive elements or radicals to form salts. In terms of the dissociation theory, it is a compound which on dissociation in solution yields excess hydrogen ions.

Acid Number (value)—A number or value which indicates the amount of free acids present in a substance. In the analysis of fats, oils, etc., it is expressed by the number of milligrams of potassium hydroxide which are required to neutralize the free fatty acids in a gram of substance.

Active Mass—A term used in connection with the law of mass action. Guldberg and Waage defined the term as the molarity of the reacting substance, or its partial pressure. Expressed in this form, the law of mass action is only approximately correct. To make the law exact, "activities" must be substituted for molarities and "fugacites" for partial pressures.

Activity—A thermodynamic term denoted by a. Activities are *effective* concentrations and have the dimensions of concentrations. When activities are employed in a mass law expression the equilibrium constant has a fixed value.

Activity Coefficient—A factor which, when multiplied by the molecular concentration, yields the active mass. The activity coefficient is evaluated by thermodynamic calculations, usually from data on the e. m. f. of certain cells, or the lowering of the freezing point of certain solutions. It is a correction factor which makes the thermodynamic calculations correct.

Additive Property—A property, the numerical value of which is equal to the sum of the values for the component parts and which depends only on the number and kinds of molecules or atoms present without any regards to their arrangements; e.g., the molecular weight, which is the sum of the weights of the component atoms.

Adiabatic Process—A process carried out in such a way that no heat is absorbed or evolved by a system.

Adsorption—A surface phenomenon exhibited by solids which consists in the adhesion, in an extremely thin layer, of the molecules of gases, of liquids, or of dissolved substances with which they are in contact.

Alcohol—Any one of a class of compounds which are analogous to ethyl alcohol in constitution in that they are hydroxides of organic radicals; specifically, the term is applied to ethyl alcohol.

Aldehyde—Any one of a class of organic compounds intermediate in oxidation between a primary alcohol and a carboxylic acid, having two hydrogen atoms less than the alcohol, and characterized by the radical −CH:O; specifically, the term aldehyde is applied to acetaldehyde, CH_3CHO.

Alicyclic—See *cyclic*.

DEFINITIONS OF CHEMICAL AND PHYSICAL TERMS

Alkali—Any compound having marked basic properties; see *base.*

Alkalinity—The combining power of a base measured by the maximum number of equivalents of an acid with which it can react to form a salt. In water analysis, it represents the carbonates, bicarbonates, hydroxides, and occasionally the borates, silicates, and phosphates in the water and is determined by titration with standard acid to certain standard datum points and expressed as milligrams of calcium carbonate per liter (nearly the same as "parts per million").

Alkaloid—An alkaline organic substance (i.e., an organic base) with marked physiological action. The term is usually restricted to substances which occur naturally in plants and animals; e.g., nicotine, quinine, morphine, etc.

Alloy—The product formed by the blending of a metal with other metals or non-metals usually by fusion and solution in each other when molten.

Alpha Radiation—The radiation of doubly positively charged particles, called *alpha particles*, emitted during certain radioactive transformations. These particles have a mass of 4.00 and are identical with the nuclei of helium atoms.

Ampere—The practical unit of intensity of electric current being defined by U. S. statute as the unvarying current which, when passed through a standard solution of silver nitrate in water, deposits silver at the rate of 0.001118 grams per second. It is equal to the current produced by an electromotive force of one volt flowing through a circuit of one ohm resistance.

Angstrom—A unit of length, used especially in expressing the length of light waves, equal to one ten-thousandth of a micron, or one hundred-millionth of a centimeter (1×10^{-8}cm.)

Anhydrous—A term meaning without water. It is usually applied in referring to the absence of water of crystallization.

Animal Oil—An oily material obtained, in any manner of various ways, from animal substances. It usually refers to a mixture of the glyceryl esters of various organic acids although it is also applied to substances other than glycerides; e.g., bone oil, which is a mixture containing pyrrole, pyridine, quinoline, amines, and other nitrogenous compounds, as well as hydrocarbons, etc., which are obtained on the destructive distillation of bones.

Anion—The charged particle in a solution of an electrolyte which, under the influence of an electrical potential, moves toward the anode. It is the negatively charged ion.

Anode—The electrode at which an oxidation process occurs. It is the negative pole of a battery, or the positive pole of a solution of an electrolyte through which current is being forced. In a vacuum tube, the anode is the electrode towards which the electrons flow within the tube.

Aqueous Tension—The vapor pressure of pure water, or the partial pressure of water vapor over any aqueous solution or solid hydrate, at any given temperature.

Athermanous—Not transmitting radiant heat; not *diathermanous* (q.v.)

Atom—According to the atomic theory, the smallest quantity of an element which is capable of entering into chemical combination or that can exist alone.

Atomic Number—A number, characteristic of an element, which designates the position of the element in the periodic table. It represents the net positive charge on the nucleus of each atom, or the number of electrons outside of the nucleus.

Atomic Radius—The radius of the volume occupied by an atom. This volume may approximate a sphere or, in many cases, a highly distorted sphere. In a given crystal, the atomic radii when added together equal the inter-atomic distances within the crystal. The ionic radius of the same species of atom will be somewhat less, or greater, than that of the atomic radius because the outermost shell of electrons has been stripped off, or increased, in the formation of the ion.

DEFINITIONS OF CHEMICAL AND PHYSICAL TERMS

Atomic Theory—A theory postulating that all elements are composed of small discrete unit particles called atoms. The atoms of any one element are supposed to be of the same size and essentially of the same weight, but differ in both from element to element. Chemical combination is the union of atoms of various elements into the smallest discrete entities of the compound; viz., the molecules.

Atomic Weight—The relative weight of the atom of an element, referred to some element taken as a standard. An atomic weight of 16 for oxygen is the one usually adopted as a basis for reference.

Average Life—In radioactivity, the reciprocal of the radioactive constant (q.v.)

Avogadro's Hypothesis—The hypothesis that equal volumes of all gases, under the same conditions of temperature and pressure, contain equal numbers of molecules.

Avogadro's Number—The number representing the number of molecules in one gram-molecular weight of any substance, as for oxygen, the number in 32 grams. It is equal to 6.061×10^{23}.

Base—A compound of a metal, or a metal-like group, with hydrogen and oxygen in the proportion to form an OH radical, which ionizes in aqueous solution to yield hydroxyl ions. A base is formed when a metallic oxide reacts with water.

Beta Radiation—See *radioactivity*.

Bicyclic—Containing two rings in the molecule, usually fused rings as in naphthalene.

Boiling Point—The temperature at which the vapor pressure of a liquid becomes equal to the external pressure. This temperature differs from the same liquid under different pressures. The *normal boiling point* is the temperature at which the vapor pressure reaches 760 mm. of mercury.

Boiling Point, Molal Elevation of—See *molecular elevation*.

Boyle's Law—The law that the volume of any gas varies inversely as the pressure upon it, providing the temperature is kept constant. It is also known as *Mariotte's law*.

Brinell Hardness—A value of the hardness of a material obtained by pressing a hardened ball, having a diameter of 10 mm., into the surface of the specimen to be tested. The weight applied to steels is 3000 kg. for 30 seconds; to brasses and bronzes 500 kg. for 60 seconds. The diameter of the impression forms the basis for calculating hardness.

British Thermal Unit (B.T.U.)—The quantity of heat required to raise the temperature of one pound of water one degree Fahrenheit at, or near, its point of maximum density (39.1°F.) The B.T.U. is equivalent to 0.252 kilogram-calorie.

Buffer—Any substance, or combination of substances, which when dissolved in water produces a solution which resists a change in its hydrogen ion concentration upon the addition of acid or alkali.

Calorie—The small calorie (*c*) is an energy unit used to measure the quantity of heat. It is equal to the amount of heat required, at a pressure of one atmosphere, to raise the temperature of one gram of water one degree Centigrade. Since the specific heat of water varies with the temperature, the rise of one degree is sometimes specified to be between certain temperature intervals (as from 0° to 1°C.; at or near the temperature of greatest density, which is 4°C.; or, at from 15° to 16°C., in which case the unit is almost exactly that of the *mean calorie*). The amount of heat required to raise one gram of water from 0° to 100°C. is the *rational calorie*, one hundredth of the rational calorie being called the *mean calorie*.

Carbocyclic—See *cyclic*.

Carbohydrate—Any one of a group of compounds composed of carbon, hydrogen, and oxygen with the ratio of hydrogen to oxygen usually as in water; viz., 2H:1O. They are neutral compounds comprising the sugars, starches, celluloses, pentosans, galactans, etc.

Catalyst or Catalytic Agent—Any substance which, by virtue of its presence,

affects the rate of a chemical reaction and which may be recovered practically unchanged at the end of the reaction. The term *contact agent* is often applied to a solid catalyst in contact with gaseous reactants.

Cathode—The electrode at which reduction occurs. It is the negative electrode in a cell through which current is being forced, but it is the positive pole of a battery. In a vacuum tube, the cathode is the electrode from which electrons are liberated; see also the term *anode.*

Cation—The charged particle in the solution of an electrolyte which, under the influence of an electrical potential, moves toward the cathode. It is the positively charged ion.

Causticity—A measure of the hydrogen ion concentration in a sample of water; see *hardness.*

Cell (galvanic or electromotive)—A combination made up of a cup, or other vessel, containing a solution of a suitable electrolyte and two suitable electrodes which dip into it. It may be used either for generating electricity by chemical action, or for use in electrolysis (in the latter case it is called an *electrolytic cell*).

Cellulose—An anhydroglucose polysaccharide which constitutes the major portion of plant materials and which can be hydrolyzed by acid into glucose. *Alpha cellulose* is the cellulosic fraction which is insoluble in aqueous 17.5% sodium hydroxide solution. *Beta cellulose* is the cellulosic fraction which is soluble in aqueous 17.5% sodium hydroxide solution and from which it can be precipitated by acidifying the solution. *Gamma cellulose* is the cellulosic fraction which is soluble in aqueous 17.5% sodium hydroxide solution in which it remains dissolved, even after the solution is acidified.

Ceramic—Pertaining to the manufacture, or the products therefrom, of material made from earth by the agency of fire, such as pottery, enamel, cement, glass, etc. For definitions of ceramic terms see special *glossary of ceramic terms.*

Charles' Law—The law that at constant pressure the volume of a gas varies directly as the absolute temperature. The variation in volume amounts to 1/273 of its volume at 0°C. for each degree Centigrade.

Chemical Equivalent—See *equivalent weight.*

Chemiluminescence—See *luminescence.*

Colligative Property—A property depending only upon the number of atoms or molecules present in a system and not upon the nature of the atoms or molecules; e.g., gaseous pressure is a colligative property.

Colloid—A state of subdivision of matter characterized by a particle size intermediate between molecular dispersion (true solution), and a size just about visible with an ordinary microscope; i.e., from 10^{-5} to 10^{-7} cm. in diameter. A colloidal substance, when apparently dissolved in a liquid, diffuses not at all or very slowly through a membrane and shows no pronounced effect on the freezing point or vapor pressure of the solvent.

Combining Weight—See *equivalent weight.*

Combustion, Heat of—The total amount of heat evolved when a definite quantity of a substance is completely burned (oxidized). It is expressed variously, as in calories per gram or per gram molecule, or (especially for fuels) in British thermal units (B.T.U.) per pound.

Compressibility, Coefficient of—The decrease in volume per unit volume produced by a unit change in pressure.

Concentrated Solution—A solution containing a relatively large amount of dissolved substance per unit volume of solvent.

Condensation, Heat of—A value numerically the same as the *heat of vaporization* (q.v.).

Conductance—The property of an electrical circuit which determines, for a

given applied potential across its terminals, the rate at which electrical energy is converted into heat. It is the reciprocal of the electrical resistance and its unit, the *mho*, is the reciprocal of the ohm.

Constant Proportions, Law of—The law of chemical combination which states that a chemical compound always contains the same elements combined in the same proportions by weight.

Constitutive Property—A property dependent on the arrangement of the molecules or atoms in a substance (constitution) rather than on their kind or number; e.g., a physical property, such as the rotation of the plane of polarized light, which depends on the arrangement of atoms within the molecule, is called a constitutive property.

Coulomb—The practical unit quantity of electricity. It is the quantity of electricity which must pass through a circuit to deposit 0.0011180 grams of silver from a solution of silver nitrate. An ampere is one coulomb per second. A coulomb is also the quantity of electricity on the positive plate of a condenser of one-farad capacity when the electromotive force is one volt.

Critical Point—The transition point at which the liquid and gaseous states of a substance merge into each other. It is the temperature above which a substance cannot exist in two phases, no matter how great the pressure. See also *critical temperature* and *critical pressure.*

Critical Pressure—The pressure which is just sufficient to cause the appearance of two phases at the critical temperature. It is the vapor pressure of a liquid at the critical temperature.

Critical Temperature—The temperature above which a gas cannot be liquefied by pressure alone. At this temperature there is no distinction between liquid and vapor, both having the same density and constituting one homogeneous system.

Critical Volume—The volume occupied by unit mass of a substance at the critical temperature *and* critical pressure.

Crystal—A homogeneous particle of solid formed by the solidification, under favorable conditions, of a chemical element, a compound, or an isomorphous mixture, whose boundary surfaces are planes symmetrically arranged at definite angles to one another in a definite geometrical form. Many chemical substances solidify into various such forms, each being quite characteristic for every substance. See also *liquid crystal.*

Crystalline Form—A combination of faces included under a general crystallographic symbol. Faces of two or more crystal forms are often exhibited by a single crystal and these supplement one another or truncate on another's edges or corners.

Crystalline System—The six (or seven) groups into which crystals are classified according to forms which are dependent upon the relative lengths and inclinations of the axes to which they are referred. The systems are the *isometric, tetragonal, triclinic, hexagonal* (including the *rhombohedral*), *orthorhombic,* and *monoclinic.* See definitions for each of these systems.

Crystalloluminescence—See *luminescence.*

Cubic Form—See *isometric.*

Cycle or Cyclical Process—A process conducted in such a manner that at the end of a complete course of operations of some kind the system is back at its starting point with restoration of the original state.

Cyclic—Pertaining to, or characterized by, a ring or closed-chain formation. Compounds in which the ring is composed solely of carbon atoms are called *carbocyclic;* of atoms of the same kind, whether of carbon or not, *isocyclic* or *homocyclic;* of atoms of different kinds, *heterocyclic;* carbon ring compounds not derived from benzene are called *alicyclic.*

Dalton's Law of Partial Pressures—In any mixture of gases the total pressure is equal to the sum of the pressures which each gas would exert were it alone present in the volume occupied by the mixture; i.e., the total pressure P is

equal to the sum of the partial pressures of the individual gases.

Decomposition, Heat of—The heat evolved or absorbed by the decomposition of a compound into its elements or into two or more simpler products, the nature of which must be specified in connection with the numerical value of the heat of decomposition. It is usually expressed in calories per gram molecule.

Decomposition Potential or Voltage—The minimum voltage required to keep a steady current passing through a solution or, in other words, to cause a steady electrolysis in the solution.

Decrepitation—The property, possessed by some crystalline material, of making a crackling noise when heated and which is due to decomposition with evolution of gases, water vapor, etc.

Deflagration—The act of burning suddenly with the appearance of flame and sparks.

Deliquescence—The liquefaction of a solid substance due to the solution of the solid by absorption of moisture from the air.

Density—The ratio of the amount of anything per unit volume; e.g., weight of any substance per unit volume at any definite temperature (see also *specific gravity*); the quantity of an electric charge distributed in space per unit volume; or, the quantity of energy per unit volume.

Depression (molecular), Coefficient of—The depression of the freezing point produced by the solution of one gram molecule of a substance in 1000 grams of the solvent.

Dew Point—The temperature at which the liquefaction of a vapor begins; the term is usually applied to condensation of moisture from the water vapor in the atmosphere.

Dextro (rotatory)—A clockwise or right-handed turning motion usually applied to the turning of the plane of polarized light.

Diamagnetic—Possessing, or pertaining to, the magnetic properties of bodies whose permeability is less than unity (i.e., less than that of a vacuum). Diamagnetic substances are repelled by a magnet if the surrounding medium is air.

Diathermanous—Possessing, or pertaining to, the property of affording a free passage of heat rays.

Dielectric—A material which does not conduct the electric current because the lines of force of an electrostatic field will pass through it, thus making it the seat of the strain.

Dielectric Constant—A constant factor (ϵ) which is part of the formula for the force between two charges separated by a dielectric; viz., $\epsilon f\gamma^2 = Q_1Q_2$, where f is the force between two charges Q_1 and Q_2 separated by a distance of γ.

Diffusion, Coefficient of—The quantity of gas traveling one centimeter per second through a surface of one square centimeter.

Dilute Solution—A solution containing a relatively small amount of dissolved substance per unit volume of solvent.

Dilution, Heat of—The heat evolved per mole of solute when a solution is diluted.

Diolefin—Any open chain hydrocarbon containing two double bonds; e.g., $CH_2{:}CH{\cdot}CH{:}CH_2$. See *olefin*.

Dissociation—The splitting up of a compound or element into two or more simpler molecules, atoms, or ions. The term is applied usually to the effect of the action of heat or other forms of energy on gases, and of solvents upon dissolved substances. Dissociation is a reversible reaction and not as permanent as decomposition; i.e., when the dissociated gas is cooled, the split parts recombine; when the solvent is removed, the ions recombine.

Dissociation, Degree of—The ratio of the amount of substance which has dissociated to the total amount originally present.

Dissociation, Heat of—The heat evolved or absorbed during the dissocia-

tion of a compound. It is usually expressed in calories per gram molecule.

Distillation—The process of heating a liquid to its boiling point, removing the vapors through a cooling and condensing apparatus, and finally collecting the condensed liquid in a separate receiver. It is commonly used for the separation of two or more liquids in a mixture, or for the separation of the solvent from dissolved substances.

Distribution Coefficient—See *distribution law.*

Distribution Law (Nernst)—The law that the ratio in which a dissolved substance distributes itself between two immiscible solvents (the *coefficient of distribution* or *partition*) is a constant at constant temperature.

Drying Oil—An oil which, when exposed in a thin film to the air, readily forms a hard, tough, elastic substance. The chemical constitution of such oils is characterized by unsaturated linkages between carbon atoms.

Dulong and Petit's Law—The principle that the specific heat of a solid element multiplied by the atomic weight is a constant equal approximately to 6.2 to 6.4.

Efflorescence—The act or process by which crystalline material changes on the surface, or throughout, to a whitish, mealy, or crystalline powder from the loss of water on exposure to the air. The term is also applied to the process of becoming covered with such a crust; e.g., bricks may effloresce because of soluble salts in them.

Electrochemical Equivalent—The weight in grams of a substance caused to react (in some cases to deposit) when one coulomb of electricity is passed through a solution of the substance. It is the 1/96,500*th* part of the gram equivalent.

Electrode—The pole or plate of an electrolytic cell by which the current enters or leaves the cell.

Electrode Potential—The difference in potential established between an electrode and a solution when the electrode is immersed in the solution. Since it is impossible to measure such a single electrode potential experimentally, the values listed in tables are relative values, the standard being a rigidly defined hydrogen electrode, which is arbitrarily given a potential of zero volts. See *Table of Standard Electrode Potentials.*

Electroluminescence—See *luminescence.*

Electrolysis—Electrolysis is the process of the passage of an electric current through a solution with simultaneous chemical changes either in the electrodes or in the solutions in contact with the electrodes, or both.

Electrolyte—Any substance which, when in solution or fused, forms a liquid which will conduct the electric current. Acids, bases, and salts are common electrolytes.

Electrolytic Dissociation Theory—The theory, first proposed by Arrhenius, which postulates that whenever an electrolyte is placed in a dissociating medium, such as water, part or all of the molecules dissociate into ions. Some of these ions are positively, the rest negatively, charged; but in any case the oppositely charged ions are present in exactly equivalent quantities.

Electromotive Force—The driving tendency behind an electric current. It is often abbreviated as e.m.f. and it is measured in volts.

Electron—The most elementary negatively charged particle which is the constituent of all matter. It is the electrical opposite of the proton and is the quantity of electricity equal to 4.77×10^{-10} c.g.s. electrostatic units. Its mass is approximately 1/1845 of that of the proton. Electrons constitute cathode rays and beta rays, and are emitted by hot bodies.

Electron Theory of Matter—The atom is pictured as a nucleus around which are arranged electrons, or negative charges, equal in number to the net charge on the nucleus. The nuclear

charge and the number of external electrons vary from element to element, increasing by one for every increase in the atomic number of the elements. The total number of external electrons is thus identical with the atomic number of the element.

Elongation—The total stretch (deformation) in the direction of load, or per unit length, caused by a tensile force. It is the amount of permanent stretch before rupture and is usually expressed as a percentage of the original length.

Emulsion—The product of the dispersion of one liquid in another liquid, the dispersed phase particles being larger than colloidal size. The liquid in which the particles or globules are suspended is called the *continuous phase*, the particles or globules the *dispersed phase*. In photography, the term is applied to the light-sensitive coating of gelatine in which silver halide salts are suspended in an extremely fine state of separation and which is applied to glass plates, film, and paper.

End Point—The point indicating the end of some operation or at which a certain definite change is observed. In titration this change is frequently a change in color of an indicator which has been added to the solution, or to the disappearance or excess of one of the reactants which is colored. In the analysis of liquids, such as gasoline, the end point is the temperature at which liquid ceases to distill over.

Entropy—A thermodynamic quantity. In any *reversible* process, the increase in entropy of any system, or part of a system, is equal to the heat which it absorbs, divided by the absolute temperature at which the heat is absorbed.

Enzyme—Any one of a class of naturally occurring, complex, organic substances which catalyze specific reactions. Enzymes are elaborated by cells of plants and animals but their action is independent of life processes.

Equilibrium (chemical)—The state in a reversible chemical reaction at which the rate of the direct action is equal to the rate of the opposing reaction.

Equilibrium Constant—According to the law of mass action, for any reaction such as: $aA + bB \ldots . \rightleftarrows dD + eE \ldots .$, $\frac{C_D^d \times C_E^e}{C_A^a \times C_B^b} = K_c$ at any definite temperature. Here C is the equilibrium concentration of the constituents in moles per liter, while K_c is a constant known as the equilibrium constant.

Equivalent Weight—One of the comparative weights of different compounds, elements, or radicals, which possess the same chemical value for reaction when compared by reference to the same standard (usually oxygen = 8). The following are examples of this relationship:
(1) An equivalent weight of an acid, or a base, is the quantity that would furnish one gram-ionic weight of hydrogen ion (1.008 grams), or hydroxyl ion (17.008 grams), respectively, if the substance were completely ionized. Thus, an equivalent of H_2SO_4 is one-half the molecular weight; an equivalent of $Fe(OH)_3$ is one-third the molecular weight. (2) An equivalent weight of a salt is the gram-molecular weight divided by the total positive, or total negative, valence. Thus, an equivalent of $Al_2(SO_4)_3$ is one-sixth of the molecular weight. (3) An equivalent weight of an oxidizing, or reducing, agent is the gram-molecular weight divided by the total change in valence of all atoms in the molecule which change valence (usually only one element). Thus, when $KMnO_4$ in acid solution is reduced to Mn^{++}, the valence of Mn decreases from $+7$ to $+2$, a change of five units. In this case, an equivalent weight of $KMnO_4$ is one-fifth the gram-molecular weight.

Essential Oil—Any one of a class of odoriferous, volatile liquids, insoluble in water, which are obtained from plants to which they impart odors and other characteristic properties. They are of various organic types, such as ethers, aldehydes, esters, etc., or mixtures of the same. Some contain dissolved resin and are known as *oleoresins*. They are sometimes called *volatile oils* in distinction from *fixed oils*.

Ester—A compound which may be regarded as formed by the replacement of the acid hydrogen of an acid, organic

or inorganic, by a hydrocarbon radical. When the radical is not specified in the name, *ethyl* is often understood; e.g., acetic ester is ethyl acetate.

Ester Number (value)—The numerical difference between the saponification number and the acid number. It is a measure of the neutral fats (esters of the fatty acids) present.

Exfoliation—The property possessed by substances which are capable of casting or throwing off from their surfaces scales, laminae, or splinters.

Expansion, Coefficient of—The ratio of the increase in length (linear coefficient), area (superficial), or volume (cubical) of a body for a given rise in temperature (usually from 0° to 1°C.) to the original length, area, or volume, respectively. These three coefficients are approximately in the ratio of 1:2:3. When not expressly specified, the cubical coefficient is usually intended.

Explosive—A substance which acts by explosive chemical reaction to liberate, at high speed, gas and heat thus causing tremendous pressure.

Factor—A quantity by which a measure must be multiplied in order to express it in other terms. The number which is used to multiply a given weight of some compound in order to obtain the equivalent weight of some other compound is called a *gravimetric factor;* similarly, volumes may be interconverted by *volumetric factors.*

Faraday's Laws of Electrolysis—The law that: (1) For any electrolyte the amount of electrolysis is proportional to the quantity of electrical current which is passed through a solution; (2) for the same quantity of current passed through solutions of various electrolytes, the amounts liberated at the electrodes are directly proportional to chemical equivalents of the electrolytes. The quantity of current required to deposit one chemical equivalent weight is one *faraday* which is equal to 96,500 coulombs.

Fat—Any one of a class of compounds, composed of carbon, hydrogen, and oxygen, which are glyceryl esters of certain acids, such as stearic, palmitic, etc. The fats are neutral in reaction and on saponification all yield glycerol. The various varieties of natural fats are mixtures of different glycerides. A fat which is liquid at room temperatures is called a *fatty oil.* See *oil.*

Fixed Carbon—The percentage of combustible material in a sample (of coal usually) which is not volatile at 950°C.

Fixed Oil—An oil which is not readily volatile as distinguished from *volatile* or *essential oil* (q.v.) The term is especially applied to the liquid fats (glycerides) found in the fatty tissue of plants and animals, and in the seeds of plants. See *oil.*

Fluid—A substance which yields readily to any force which tends to alter its shape. Fluids possess no definite shape. The term includes both liquids and gases.

Fluorescence*—The property of emitting radiation as the result of absorption of radiation from some other source. The emitted radiation persists only as long as the exposure is subjected to radiation which may be either electrified particles or waves. The fluorescent radiation generally has a longer wave length than that of the absorbed radiation. If the fluorescent radiation includes waves of the same length as that of the absorbed radiation it is termed resonance radiation. See *Raman effect.*

Formation, Heat of—The heat evolved or absorbed when a compound is formed by direct union of its elements at some stated temperature. It is usually expressed in calories per gram-molecule of the compound.

Formula Weight—The sum of the atomic weights of all the atoms appearing in a chemical formula.

Free Energy—A thermodynamic term. Absolute values for free energy are unknown but when a system changes from one state to another at constant temperature and pressure, the decrease in free energy is numerically equal to the maximum useful work which can be done. This does not include work done on or by the atmosphere.

* For laws, see *photochemistry.*

DEFINITIONS OF CHEMICAL AND PHYSICAL TERMS

Freezing Point—The temperature at which a liquid solidifies. It is the temperature at which the liquid and solid states of a substance are in equilibrium at a given pressure (usually atmospheric). For pure substances it is identical with the melting point of the solid form.

Fusion, Latent Heat of—The amount of heat which must be supplied at the melting point to a unit quantity of a solid in order to transform it into a liquid at the same temperature (usually at standard pressure). The term is also called *heat of fusion.* It is usually expressed in calories per gram, or B.T.U. per pound.

Gamma Radiation—A form of radiation emitted by certain radioactive substances. This radiation is similar to, but of shorter wave length than, X rays (about 10^{-8} to 10^{-9}cm.) Like X rays, it is used in cancer therapy.

Gas—An aeriform fluid, having neither independent shape nor volume, but tending to expand indefinitely. Without qualification, the word is often popularly used to denote anesthetics, combustibles (gasoline), poisonous war materials, etc., whether liquids or solids at ordinary temperatures.

Gas Constant—A general term for all gases, being the term R in the ideal gas law equation: $PV = nRT$. It is an energy term equal to 0.08205 liter-atmospheres per degree per mole; or, 1.986 calories per degree per mole; or, 8.314×10^7 ergs per degree per mole.

Gay-Lussac's Law of Volumes—The law that in gaseous reactions the volume of the combining gases, if at the same pressure, bear to each other, as well as to the product of the reaction, a simple whole numbered relationship. That is, the volume of the product is either equal to the sum of the volumes of the reactants or is less than, and bears a simple ratio to, this sum.

Gibbs' Phase Rule—An equation advanced by Gibbs which defines the general conditions under which a system of several phases may be in heterogeneous equilibrium. It is: $F = C - P + 2$. Here F is the number of degrees of freedom of a system (i.e., the number of independent variables which must be fixed to completely define the system); C is the smallest number of components in terms of which the chemical composition of each phase may be described by means of a chemical equation; and P is the number of phases present at any stage.

Glucoside—Any one of a class of compounds, either natural or synthetic, which on hydrolysis yields a sugar, usually glucose, and one or more substances. Widely distributed in plants, they are generally white or colorless, crystalline compounds, often bitter, poisonous, and optically active. They are hydrolyzed by enzymes which are often present in the same plant from which they are obtained, by alkalies and by acids. Similar compounds derived from other aldose sugars or ketose sugars are called *aldosides* or *ketosides*, respectively.

Graham's Law of Effusion—The mean (root-mean-square) velocities of the molecules of two gases are inversely proportional to the square roots of their densities or of their molecular weights. If two gases are forced through the same small aperture, under the same pressure difference, then the rates of effusion (the time required for the same weight of each gas to pass through the aperture) are inversely proportional to the mean velocities of the molecules, and therefore directly proportional to the square roots of the molecular weights or of the densities.

Gram-atomic Weight—The mass, in grams, of an element equal numerically to its atomic weight.

Gram-molecular Weight—The mass, in grams, of an element or a compound equal numerically to its molecular weight.

Gravimetric Factor—See *factor.*

Grotthus, Law of—The law that only those rays of light which are absorbed produce chemical change.

Guldberg and Waage's Law—See *mass action law.*

DEFINITIONS OF CHEMICAL AND PHYSICAL TERMS

Gum—Any one of a class of colloidal substances exuded by, or extracted from, plants. Gums are either soluble in water, or swell up and become glutinous when moist but harden on drying. The term is often applied to a variety of other plant exudations such as resins, gum resins, etc.

Half Period or Half Life—A term used in chemical kinetics to denote the time (in years, days, seconds, etc.) for half of a given initial quantity of material to decompose.

Hardness (of water)—The hardness or soap destroying power of water is due principally to the calcium and magnesium ions present in the water and is independent of the accompanying acid ions. The *total hardness* is measured in terms of "parts per million" of calcium carbonate (more accurately milligrams of calcium carbonate per liter). It may be divided into two parts, the "temporary" and the "permanent" hardness. The *temporary hardness* is that part of the total hardness which is removed by boiling and corresponds roughly, but not quantitatively, to the calcium and magnesium bicarbonates in the water. The *permanent hardness* is that remaining after boiling and is due principally to the sulfates, chlorides, and nitrates of calcium and magnesium, and to the small amount of carbonates still held in solution. The total hardness also may be divided into the "alkalinity" or "carbonate" hardness and the "non-carbonate" hardness. The *alkalinity* of a natural water represents its content of carbonates, bicarbonates, hydroxides, and occasionally borates, silicates, and phosphates. It is determined by titration with dilute (usually 0.02 *N*) sulfuric acid to a methyl orange end point. Alkalinity is roughly equivalent to the temporary hardness. The difference between the total hardness and the alkalinity is the *non-carbonate hardness*, which is roughly equivalent to the permanent hardness. When the hardness of a water is greater than its alkalinity, the amount of hardness due to the alkalinity is called *carbonate hardness* and the amount of hardness in excess of this is called *non-carbonate hardness* or *incrustants;* when the hardness of a water is less than its alkalinity then the alkalinity, or part of the alkalinity, will be the *carbonate hardness* and the excess of the alkalinity over the hardness is called *negative non-carbonate hardness.* The *causticity* of a water is that part of its alkalinity due to hydroxides.

Heat Capacity—The *average* or *mean heat capacity* of a system, between any two given temperatures, is the quantity of heat required to raise the temperature of the system from the lower to the higher temperature divided by the difference between the two temperatures. The *true heat capacity*, c, at any given temperature is defined by the differential equation:

$c = \left(\frac{q}{dT}\right)$, where q is the infinitesimal amount of heat required to change the temperature by an amount dT, at the given temperature. The heat capacity is usually determined either at constant pressure, or at constant volume. The heat capacity per gram is the *specific heat.* The heat capacity per mole is called the *molar heat capacity* (at constant pressure or volume).

Hehner Number (value)—A number expressing the percentage (i.e., grams per 100 grams) of water-insoluble fatty acids in an oil or fat.

Henry's Law—The law that the solubility of a gas in a liquid is directly proportional to the pressure of the gas above the liquid at a definite temperature.

Hess' Law of Heat Summation—The law that the quantity of heat liberated or absorbed in any chemical transformation is independent of the manner in which the reaction takes place, provided the initial and final states are the same in every case. That is, the total heat of the reaction is the sum of the heats of the various intermediate steps. This is true only if all steps of the process are carried out either at constant volume or at constant pressure.

Heterocyclic—See *cyclic.*

Hexagonal System—One of the groups of crystalline form (including the *rhombohedral* division) in which three equal

lateral angles intersect at angles of 60° and with a vertical axis of variable length at right angles, as in the hexagonal prism.

Homocyclic—See *cyclic.*

Humidity—In hygrometry the *absolute humidity* is the amount of vapor actually present in the air and is expressed either in its expansive force, or in its weight per given volume. *Relative humidity* is the ratio of the quantity of vapor actually present to the greatest amount possible at the given temperature. Complete saturation of the air by a vapor is designated as humidity 100.

Hydration, Heat of—The heat evolved or absorbed when hydration occurs. It is the difference between the heats of solution of the anhydrous and the hydrated forms. It is usually expressed in calories per gram molecule.

Hydrocarbon—A chemical compound containing only hydrogen and carbon.

Hydrogen Ion Concentration—The concentration of hydrogen ions in a solution in gram-ionic weights per liter. See *pH.*

Hydrometer—A floating instrument for determining specific gravities, especially of liquids and solutions. It is usually a hollow glass or metal instrument, weighted at one end so as to float upright. The stem of the instrument is graduated so as to indicate the gravity of the liquid. Many instruments, for use with specific solutions, have arbitrary scales and are usually known by the names of the inventors. See special section on *Hydrometers.*

Hygroscopic—Readily absorbing, becoming coated with, and retaining moisture but not enough to make a liquid. See *deliquescence.*

Indicator—A substance, which by some visible change, such as a change of color, indicates the condition of a solution as to the presence of free acid, alkali, or other substance. Indicators are employed in volumetric (titrimetric) analysis to indicate the end points of reactions.

Inorganic—Designating, or pertaining to, the branch of chemistry which deals with substances of earthy or mineral matter. It includes the treatment of all substances with the exception of those classed as *organic* (q.v.)

Intumescence—A swelling or bubbling caused by heat.

Iodine Number (value)—A number expressing the percentage (i.e., grams per 100 grams) of iodine absorbed by a substance. It is a measure of the proportion of unsaturated linkages present and is usually determined in the analysis of oils and fats.

Ion—In electrolytic phenomenon, a particle bearing an electric charge which is formed when a neutral atom, or group of atoms, loses or gains one or more electrons. Loss of electrons results in positive charges producing a *cation;* gain of electrons results in the formation of an *anion* with negative charges. The valence of an ion is equal to the number of charges borne by it. In some crystals, such as NaCl, ions are supposed to form the units of the space lattice. Solution of such a crystal in an ionizing solvent such as water merely separates the ions. In other cases, ionization probably does not occur until the substance is dissolved in the solvent. Gaseous ions may be formed by the exposure of a gas to X rays, fast moving electrons, alpha or beta particles, etc.

Ionic Radius—See *atomic radius.*

Ionization Constant—The equilibrium constant for the reversible dissociation of a weak electrolyte. For example, if the weak acid HA dissociates into H^+ and A^-, then

$$K_i = \frac{(C_{H^+})\ (C_{A^-})}{(C_{HA})}$$

where K_i is the ionization constant if the concentrations of ions is expressed in gram-ionic weights per liter and the concentration of the unionized molecules, HA, is expressed in gram-moles per liter. See *equilibrium constant.*

Ionization, Heat of—The amount of heat evolved or absorbed when a definite amount of a solute ionizes. It is usually expressed in calories per gram molecule.

DEFINITIONS OF CHEMICAL AND PHYSICAL TERMS

Ionization Theory—See *electrolytic dissociation theory.*

Isocyclic—See *cyclic.*

Isometric System—One of the groups of crystalline form in which the three axes of a crystal are at right angles, as in the cube, regular octahedron, etc.

Isotopes—Forms of an element that differ from one another in the mass of their atoms and in the properties dependent on that mass. Having the same atomic number and the same number of valence electrons, isotopes occupy the same position in the periodic table and have identical chemical properties. They are distinguishable only by the small differences in atomic weight or by radioactive transformations.

Izod—The units of impact strength as obtained on an Izod impact testing machine.

Ketone—Any one of a class of compounds having two hydrogen atoms less than a secondary alcohol, and characterized by the carbonyl group (:CO) united to two hydrocarbon radicals.

Kinetic Energy—Energy, or the capacity for performing work, which a body or system possesses by virtue of its motion.

Kinetic Theory of Gases—The theory that all gases are made up of discrete spherical entities, molecules, which are in constant motion. It is assumed that the molecules move in straight lines with high average velocity, continually encountering one another, and hence changing their individual velocities and directions by perfectly elastic collisions. The distances between the molecules are large compared with their size. Temperature is due to the average kinetic energy of these molecules, while pressure is caused by the bombardment of the walls of the container by the molecules.

Latent Heat of Vaporization (or of fusion)—See *heat of vaporization (or of fusion).*

Lattice (or space-lattice)—The geometrical arrangement of the atoms in a crystal as disclosed by X ray analysis. It is the sum total of the points of intersection of any three sets of equidistant parallel planes.

Le Chatelier-Braun Principle (or law)—When a system, which is in equilibrium, is subjected to a stress, the system tends to adjust itself in such a way as to partly relieve the stress. The stress may be an increase or decrease in temperature, in pressure, in the concentration of one of the reactants or one of the products, etc. For example, in the equilibrium: $2NH_3 \leftrightarrows N_2 + 3H_2$, if the pressure is increased the equilibrium will be shifted toward the left because two ammonia molecules occupy less space than three molecules of hydrogen plus one molecule of nitrogen; the shifting of the equilibrium in this direction will tend to counteract the pressure stress in this case.

Levo (rotatory)—A counterclockwise or left-handed turning motion usually applied to the turning of the plane of polarized light.

Lignin—A plant material which, in conjunction with cellulose, forms the cell walls and the cementing material between them in woods and many plants. It can be isolated by means of aqueous 72% sulfuric acid under properly controlled conditions of temperature and time.

Liquefaction—The act or process of transforming any substance into a liquid, especially the conversion of a solid into a liquid by heat, or of a gas into a liquid by cooling or pressure.

Liquefaction, Heat of—This is also called heat of fusion or of condensation. See *fusion, heat of.*

Liquid—A form of fluid which is characterized by free movement of the constituent molecules among themselves but (differing in this respect from gases) without the tendency to separate from one another. Liquids differ from solids in yielding easily to pressure and the ease with which their particles move upon one another, thus causing them to adopt themselves to the shape of the containing vessel. See also *fluid.*

DEFINITIONS OF CHEMICAL AND PHYSICAL TERMS

Liquid Crystal—A liquid having certain physical properties characteristic of crystals, such as double refraction and interference colors. It is an anisotropic liquid.

Loss of Head (or friction loss)—The pressure lost in a pipe line due to the velocity of the liquid in the pipe line, the condition of the pipe wall, and the alignment of the pipe. It is usually expressed as loss of head in feet per thousand feet of pipe.

Luminescence—Any emission of light occurring at low temperatures and not caused by incandescence. It may be produced in various ways, such as, by chemical action (chemiluminescence); by electric action (electroluminescence); by crystallization (crystalloluminescence); by friction (triboluminescence); by moderate and sudden heating of substances previously exposed to light or cathode rays (thermoluminescence); by exposure to light (photoluminescence; called *fluorescence* if observed during excitation, and *phosphorescence* if observed after excitation); by autoluminescence of radioactive substances (without exposure to light or external excitation).

Magnetic—See *diamagnetic* and *paramagnetic.*

Malleable—Possessing the property of being shaped or extended by beating with a hammer or by pressure of rollers.

Mariotte's Law—See *Boyle's law.*

Mass Action, Law of—The law, established by Guldberg and Waage, that the rate of a chemical reaction is proportional at any instant to the active masses of the reacting substances. By "active mass" is meant the molecular concentration of the substance available for chemical reactions; i.e., the number of moles per unit volume. For dissolved substances the active mass may sometimes be expressed in terms of osmotic pressure, and with gases in terms of the partial pressures of the reactants.

Mass Number—The mass of the individual atoms of an isotope compared with the value of 16.0000 as the mass of the atom of the most abundant isotope of oxygen. It is the whole number nearest the isotopic weight.

Maumene Number (value)—The maximum rise in temperature, expressed in degrees Centigrade, obtained by slowly introducing 10 cc. of concentrated sulfuric acid into 50 g. of oil.

Mechanical Equivalent of Heat—The amount of work which is equivalent to one calorie of heat. It is equal to 4.1852 $\pm$ 0.0006 absolute joules per gram-calorie (15°).

Melting Point—The normal melting point of a solid is the temperature at which the solid and the liquid phases of the material are in equilibrium, under a pressure of one atmosphere.

Metal—In a broad sense (including alloys, q.v.), a metal is any one of a class of substances which typically show metallic luster, are good conductors of heat and electricity, are opaque, are malleable and ductile, and may be fused. In a narrow sense, the term refers to metallic elements.

Metal Shrinkage (or pattern maker's allowance)—The allowance which must be taken into account in constructing a pattern because of the diminution in volume (shrinkage) which occurs when metal passes from the liquid to the solid form.

Metalloid—See *metal* and *nonmetal.*

Methoxyl Number (value)—The amount of methoxyl, a chemical radical CH_3O, which occurs as a substituent group in some substances and which can be determined as methyl iodide by treating the substances with hydriodic acid.

Mho—See *conductance.*

Mineral—Any element or compound occurring naturally in the mineral kingdom as distinguished from occurrence in either the vegetable or animal kingdoms.

Mineral Oil—Any oil of mineral origin as distinguished from plant and animal oils. The mineral oils include such

materials as petroleum, shale oil, or oils obtained from them by distillation. They are essentially mixtures of hydrocarbons.

Modulus (coefficient) of Elasticity—The modulus of elasticity is the ratio of the internal stress to the strain giving rise to it. For any special type of deformation it is a number characteristic of each substance. Special coefficients are used for deformations involving changes both in volume and in shape. Young's modulus is most often used and applies to the stretching of a wire or rod, or to the compression of a pillar; it is the ratio of F/A to l/L, where F is the increase in the force acting over the cross section whose area is A, corresponding to a change in length l of a wire or rod whose original length was L.

Molality—The strength of a solution expressed in gram moles of solute per 1000 grams of solvent; e.g., a solution containing 2 moles of sodium chloride per 1000 grams of water is 2 molal.

Molarity—The strength of a solution expressed in gram moles of solvent per liter of solution.

Mole (or mol)—The weight of a substance equal numerically to its molecular weight. A gram-mole is the weight in grams equal to the molecular weight; a pound-mole is the weight in pounds equal to the molecular weight.

Molecular Depression (or lowering)—See *depression (molecular), coefficient of.*

Molecular Elevation—The increase of the boiling point in degrees Centigrade produced by the solution of one gram molecular weight of a substance in 1000 grams of a specified solvent.

Molecular Volume—The quotient obtained by dividing the molecular weight of a substance by its density in grams per cubic centimeter at the desired temperature is the molecular volume in cubic centimeters per gram-mole.

Molecular Weight—The sum of the atomic weights of all the constituent atoms in the molecule of an element or a compound.

Molecule—When atoms combine they form a molecule. In the case of an element or a compound, a molecule is the smallest unit which chemically still retains the properties of the substance in mass.

Mole (or mol) Fraction—The quotient obtained by dividing the number of moles of any one substance in a system by the total number of moles of all substances in the system.

Monoclinic System—One of the groups of crystalline form in which there are three unequal axes, with one oblique intersection, as in the oblique rhombic prism.

Neutralization, Heat of—The heat evolved in dilute solution by neutralization of a gram equivalent of an acid with a base at some specified temperature. For strong acids and bases, the heats of neutralization are nearly constant, the average being 13,800 gram calories per gram-mole at 20°C.

Non-carbonate Hardness—See *hardness.*

Nonmetal—An element which does not possess the properties of a metal (q.v.) Unlike the metals, the nonmetals form stable compounds with hydrogen and do not form basic oxides or hydroxides. Certain elements, such as arsenic and antimony, are classed as *metalloids* because they share certain properties of both the metals and the nonmetals.

Normal Solution—A solution of such a concentration that it contains one gram-equivalent of a substance per liter of solution.

Octane Number—This is a number which is a measure of the antiknock value, or better of the detonation characteristic, of a motor fuel. It represents the percentage by volume of "iso-octane" (2,2,4-trimethylpentane) in a mixture of iso-octane and normal heptane which gives the same amount of detonation as the fuel to be rated *when tested under the same conditions.* Cf. ASTM Standards of Petroleum Products and Lubricants, No. D-357-34T.

DEFINITIONS OF CHEMICAL AND PHYSICAL TERMS

Ohm—The international ohm is the resistance offered at 0°C. by a column of mercury 106.300 centimeters in length, of constant cross-sectional area, and weighing 14.4521 grams. Such a column has a cross-sectional area of approximately one square millimeter.

Oil—Any one of a large class of substances which are liquid at room temperature, soluble in ether and in alcohol, insoluble in water, and usually lighter than water. They are classified in various ways; from their origin, as *mineral*, *vegetable*, and *animal;* according to their behavior when heated as *fatty* or *fixed*, and *essential* or *volatile*. The fixed oils are further subclassified as *drying*, *semi-drying*, and *non-drying*, according to the degree with which they absorb oxygen thus becoming hard and resinous when exposed in a thin film to the air. See also *fat*, and *wax*.

Olefin—Any open-chain hydrocarbon containing one double bond. Olefins are members of the ethylene series and have the general formula C_nH_{2n}. Somewhat similar hydrocarbons, but having two, three, or more, double bonds, are called diolefins or dienes (C_nH_{2n-2}), triolefins or trienes (C_nH_{2n-4}), etc.

Oleoresin—See *essential oil*.

Optical Activity—Possessing the property of rotating the plane of polarized light. See *polarization*.

Organic—Designating, or pertaining to, the branch of chemistry which treats of the hydrocarbons and their derivatives (or, which is almost the same, the chemistry of the carbon compounds), whether of natural or of synthetic origin.

Orthobaric Density—The density of a liquid substance and the density of the vapor of the substance in equilibrium with the liquid at a given temperature and pressure. As the temperature rises, the density of the liquid decreases, while the density of the vapor increases, until they become equal at the critical temperature and critical pressure.

Orthobaric Volume—The reciprocal of the orthobaric density. See *orthobaric density*.

Orthorhombic System—One of the groups of crystalline form in which there are three unequal axes at right angles, as in the right rhombic prism.

Osmotic Pressure—The unbalanced pressure which gives rise to the phenomena of diffusion and of osmosis; as when a solution is separated from a pure solvent or from another solution of different concentration by a semi-permeable membrane, molecules of the solvent will diffuse through the membrane from the more dilute to the more concentrated solution. The hydrostatic pressure required to stop this diffusion is the osmotic pressure. Closely related to gas pressure, it is proportional to the absolute temperature and also to the molecular concentration, and apparently it is equal to what the pressure of the dissolved substance would be if it were a gas at the same temperature and had a volume equal to that of the pure solvent.

Oxidation—In a broad sense oxidation is the increase in positive valence or decrease in negative valence of any element in a substance. On the basis of the electron theory, oxidation is a process in which an element loses electrons. In a narrow sense, oxidation means the chemical addition of oxygen to a substance.

Oxidation, Heat of—The heat evolved when a substance is oxidized. It is usually expressed in calories per gram-molecule.

Oxidizing Agent—A chemical reagent which causes oxidation of other substances and is thereby reduced. See *oxidation* and *reduction*.

P (proton) Number—A term used, instead of isotopic weight, to designate the whole-numbered atomic weight or the number of hydrogen nuclei.

Packing Fraction—The packing fraction of any atomic species is equal to $(A - W)/W$, where A is the exact atomic weight of the species and W is the integer nearest to A. Values 10,000 times larger than the values given in the preceding definition are also called the packing fraction and commonly employed.

DEFINITIONS OF CHEMICAL AND PHYSICAL TERMS

Parachor—A constant dependent on the constitution of a compound and related to its molecular volume. Being an additive property, it finds application in organic chemistry for checking structure of compounds. The parachor (P) is equal to $(M \times \gamma^{\frac{1}{4}})/(D - d)$, where M is the molecular weight, γ the surface tension, D the density of the liquid, and d the density of the vapor at the same temperature.

Paramagnetic—Possessing, or pertaining to, the magnetic properties of bodies whose permeability is greater than unity (i.e., greater than that of a vacuum). Paramagnetic substances are attracted by a magnet if the surrounding medium is air. See *diamagnetic.*

Partial Pressure, Law of—See *Dalton's law.*

Partition Coefficient—See *distribution law.*

Pearl—A term used in pharmacy for a glass capsule containing some volatile liquid for inhalation, as amyl nitrite. For use, the capsule is crushed in a handkerchief and the vapors inhaled therefrom.

Pentosan—Any one of a group of anhydropentose residues which generally occur as polysaccharides in plant materials and which can be hydrolyzed by acid to pentose sugars.

Perfect Gas—A perfect or ideal gas is one which fulfills two conditions: (1) the equation $PV = nRT$ is obeyed exactly when the temperature T, the pressure P, and the volume V are varied (n is the number of moles of gas, and R is the gas constant, q.v.); and, (2) its internal energy E is a function of the temperature alone, and does not change with a change in volume of the gas at a constant temperature.

Periodic Law—The law that the chemical and physical properties of the elements are periodic functions of their atomic numbers. By periodic function is meant that the properties repeat at certain intervals. See *periodic table.*

Periodic Table—A table in which the elements are arranged in order of increasing atomic number. Elements of similar properties are placed one under the other, yielding families or groups of elements of which there are eight. Within each group there is a gradation of chemical and physical properties, but in general a similarity of chemical behavior. From group to group, however, there is a progressive shift of chemical behavior from one end of the table to the other.

pH—The exact significance of pH is still in dispute (cf. *J. Am. Chem. Soc. 60, 1094 (1938)*). It is commonly considered to be the negative logarithm (to the base 10) of the hydrogen ion concentration of a solution. Others interpret it as the negative logarithm of the "activity" of the hydrogen ions in a solution. Exactly, neither is correct but the experimental determination of pH continues to offer valuable information as to the immediate acidity, as contrasted to the total acidity, (which may be titrated), of a solution. The experimental meaning of pH is given by the following equation: pH = (e.m.f. of H_2-calomel cell − e.m.f. of calomel half-cell at temp. T)/0.000198322T.

Phenol—Any one of a series of aromatic hydroxyl derivatives which has the OH group directly attached to the ring and of which phenol (carbolic acid) is the type. Specifically the term phenol is applied to carbolic acid, C_6H_5OH.

Phenol Coefficient—The ratio of the dilution of a disinfectant required to kill the Hopkins strain of typhoid bacillus under carefully controlled conditions in a specified time compared with the dilution of phenol required for the same organism under the same conditions. Usually 2.5 and 15 minute time limits are used and the coefficient is calculated from the average of these two. For example, if 1:80 and 1:110 dilutions of phenol kill in 2.5 and 15 minutes, respectively, and the corresponding dilutions of a disinfectant under test are 1:375 and 1:650, then the phenol coefficient of the disinfectant is $\frac{1}{2}[(375/80) + (650/110)]$ or 5.30.

Photochemistry—The branch of chemistry concerned with the effect of radiant energy, especially light, in causing chemical changes. *First law (Grotthuss-*

Draper law)—Only that light which is absorbed can act chemically. *Bunsen-Roscoe law*—The amount of material transformed in a photochemical change is proportional to the product of the light intensity and the time of illumination. *Second law* (*Einstein photochemical equivalence law*)—Each absorbed quantum should cause one light-absorbing molecule to react. *First law of fluorescence* (*De Ment absorption law*)—Energy must be absorbed by a luminescent system before emission can occur. *Second law of fluorescence* (*Stoke's emission law*)—The energy emitted as light during fluorescence is less than the energy absorbed as light for excitation; i.e., the absorbed wave lengths are shorter than the emitted wave lengths. *Third law of fluorescence* (*luminescence equivalence law*)—The absorption of radiation by a luminescent system is a quantum process involving one quantum per absorbing particle (e.g., atom or "center"), the yield being unity in the ideal case.

Photoluminescence—See *luminescence.*

Pitot Tube—A device used to measure the velocity of fluid flow. It consists of a tube with a short right-angled bend, placed vertically in the moving body of fluid with the bent part lowermost and its opening normal to the direction of flow.

Planck's Constant—The term h in the fundamental equation of the quantum theory: $\Delta E = h\nu$, where ΔE is the difference in energy of an electron in two different orbits of an atom, ν the frequency of the radiation emitted by the atom when the electron jumps from one orbit to the other in which its energy is less, and h a universal constant with dimensions the same as those of action. It is equal to 6.55×10^{-27} erg-seconds.

Plastic—A substance capable of, or the property of, being deformed continuously and permanently in any direction without rupture, under a stress greater than the yield value.

Polar—Designating, or characterized by, a union of atoms in which the bonds are electrostatic attractions between oppositely charged particles (ions). Thus, in potassium chloride (KCl), the potassium atom has lost an electron to the chlorine thereby becoming positively charged (K^+), while the chlorine has thereby become negatively charged (Cl^-). The term polar is used also to designate molecules which possess a permanent *electric moment*, or *dipole moment*, μ.

Polarization (of light)—The act or process of affecting light in such a manner that the vibrations assume a definite form. In nonpolarized light the vibrations are in all directions perpendicular to the ray, whereas in polarized light the paths of the vibrations (all in a plane perpendicular to the ray) may be straight lines, *plane polarized;* or circles, *circularly polarized;* or ellipses, *elliptically polarized.*

Potential Energy—Energy which a system possesses by virtue of its position or configuration.

Potentiometer—An apparatus for the dividing of a given potential into any fractional part. An instrument for measuring or comparing electromotive forces, in which the impressed potential is opposed by a known potential until there is no current flow.

Primary Standard—A term in analytical chemistry designating a substance of constant composition and of sufficient purity to be used for standardizing volumetric (titrimetric) solutions, or which may be used for the preparation of volumetric (tritrimetric) solutions, and when made up to an exact volume the solution requires no further standardization.

Proof Spirit—In the United States proof spirit is an alcoholic liquor of specific gravity $0.93426\frac{60}{60}$°F. Such a solution contains one-half its volume of an alcohol with the specific gravity 0.7939^{60}° F. which represents 42.49% of absolute alcohol by weight, or 50 parts of alcohol to 53.71 parts of water by volume, the apparent excess of water being due to a contraction in volume on mixing the alcohol with the water. Liquors containing less alcohol than proof spirit are termed *under proof;* thus, 10% or 10° under proof is a spirit which at 60°F. contains 90 volumes of proof

spirit and 10 of water. Similarly a 25° *overproof* (or *above proof*) indicates a spirit of such a concentration that 100 volumes at 60°F. must be diluted with water to 125 volumes to obtain proof spirit. Although the laws in the United States are worded in terms of proof spirit, it is more customary to express the concentration of alcohol in % by volume.

Protein—Any one of a class of naturally occurring compounds containing carbon, hydrogen, oxygen, nitrogen, often sulfur, phosphorus, occasionally iron and a few other elements. They are essentially very complex combinations of amino acids and are constituents of all living cells both animal and vegetable. They combine with both acids and bases, and are usually amorphous and colloidal. Since most proteins contain about 16% nitrogen, it is customary in analytical chemistry to multiply the total nitrogen by the factor 6.25 in computing the per cent of protein in a sample. Proteins are an essential constituent of the diet of the animal organism.

Proton—The positive nucleus of the light isotope of hydrogen. It forms the principal part of the atomic mass of hydrogen. The nuclei of the heavier elements are supposed to be whole number multiples of the proton although it is not known whether or not protons exist as such in these nuclei.

Proton Number—See *P number*.

Quantum—The "bundle" of radiant energy which, according to the quantum theory, is emitted as a unit by a "resonator" vibrating with a frequency ν. The energy of such a bundle (i.e., of a quantum) is equal to $h\nu$, where h is Planck's constant (q.v.)

Radical—A group of atoms remaining unchanged during a series of reactions and which may be regarded as playing the part of a single atom. See special *table of radicals*.

Radioactive Constant—The constant λ in the equation for the rate of change of radioactive material: $E = E_0 e^{-\lambda t}$, in which E_0 is the initial quantity of radioactive material undergoing change, E the quantity remaining unchanged after the lapse of any interval of time t, e the base of the Naperian logarithmic system, and λ the radioactive (decay) constant, by which is meant the fraction of the total which changes in unit of time.

Radioactivity—The property possessed by certain elements and their compounds of spontaneously emitting radiation by the disintegration of the nuclei of the atoms. The radiation consists of alpha or beta rays. Alpha rays are emitted when an atom loses a helium nucleus and thereby changes to an atom with an atomic number two units lower. Beta rays are the result of the loss of an electron from the nucleus whereby an atom is formed with an atomic number one unit higher. These changes are sometimes accompanied by the emission of gamma rays which are vibrations of high frequency. A series of such changes (disintegration series) continues until a stable product (an isotope of lead) is formed.

Raman Effect—The changing of the wave length of some of the scattered rays when a beam of light is passed through a pure liquid or vapor. It is useful in the determination of constitution.

Raoult's Law—The lowering of the vapor pressure of a solvent due to the presence of dissolved solute, divided by the vapor pressure of the pure solvent, is equal to the mole fraction of the solute. The law may be used for the calculation of the vapor pressure of solutions containing non-volatile solutes, or the partial pressure of the solvent if the solute is volatile. This law plays the same role with solutions as do the perfect gas laws in the case of gases; i.e., it expresses the conditions which exist in an ideal solution. It does not hold for electrolytes because of dissociation.

Rare Earth—Any one of a series of very similar oxides of metals with consecutive atomic numbers from 57 through 71 (with the exception of cerium, No. 58, which is sometimes considered not to be a member of the series) and a characteristic valence of three. They occur in widely distributed but relatively scarce minerals.

DEFINITIONS OF CHEMICAL AND PHYSICAL TERMS

Reacting Weight—See *equivalent weight.*

Reaction, Heat of—The heat evolved or absorbed during a chemical reaction in which the final state of the system is brought to the same temperature as that of the initial state. The numerical values for heats of reaction usually accompany a chemical equation expressing the reaction and are for the number of gram-moles (usually) involved in the equation as written.

Reaction (or van't Hoff) Isochore—The equation which represents the variation of the equilibrium constant with temperature: $d \ln K_c / dT = Q/RT^2$, where $\ln K_c$ is the logarithm to the base e of the equilibrium constant obtained when the "active masses" of the products and reactants are measured in moles per liter at the absolute temperature T; R is the gas constant expressed in calories per degree per mole (1.986); and Q is the heat of the reaction at constant volume expressed in calories.

Reducing Agent—A chemical reagent which brings about the reduction of some other substance and is itself simultaneously oxidized. See *reduction* and *oxidation.*

Reduction—In a narrow sense reduction means the decrease in the oxygen content, or the increase in the hydrogen content, of a substance. In a broad sense, reduction is the decrease in positive valence or the increase in negative valence of an element. See also *oxidation.*

Reflection, Law of—The law that light, falling upon a plane surface, is so reflected that the angle of incidence is equal to the angle of reflection, and that the incident ray, the reflected ray, and the normal all lie in the same plane.

Refractive Index—See *refraction, index of.*

Refraction—The deflection from a straight path suffered by a ray of light in passing obliquely from one medium into another in which its velocity is changed. See also *refraction, index of.*

Refraction, Index of—A constant, characteristic of each substance, which represents the ratio of the velocity of light in a vacuum to that in the substance. It is the ratio of the sine of the angle of incidence to the sine of the angle of refraction when light passes obliquely into a medium. It varies with the temperature, pressure, wave length of light, and with the media. *Absolute index* is the ratio of the velocity of light in a vacuum to that in a given medium. Since the index of refraction of air is so near unity, it is commonly used as a more convenient standard than a vacuum. *Relative Index* is the ratio of the velocity of light in two different media. See also special section *index of refraction.*

Reichert-Meissl Number—The number of milliliters of decinormal alkali required for neutralization of the volatile water-soluble fatty acids obtained from 5.5 grams of a fat or oil by a certain method of saponification and distillation. The number is a measure of the amount of low molecular weight fatty acids present in the sample.

Resin—A solid or semi-solid, amorphous (noncrystalline) organic substance which often softens and melts but not at any definite temperature. The natural resins are chiefly of plant origin, usually yellowish to brown in color, soluble in alcohol, ether, etc., but not in water. They are chiefly excretion products and exude from plants alone or as mixtures with essential oils, with gums, etc. Some are found as fossils after decay of the plant. The term is also applied to synthetic products of various types of chemical combinations which possess many of the same properties as the natural resins. They are all nonconductors of electricity and many are transparent or translucent.

Resistivity—The electrical resistance offered to the passage of a steady current. The specific resistance of a material is numerically equal to the resistance of a cylinder one centimeter in length and one square centimeter in cross-section.

Rhombohedral System—A division of the hexagonal system (q.v.) in which the form is referred to three equal oblique axes parallel to the faces of the fundamental rhombohedron.

DEFINITIONS OF CHEMICAL AND PHYSICAL TERMS

Roentgen Ray—See *X ray*.

Salt—Any one of a class of similar compounds formed when the acid hydrogen of an acid is partly or wholly replaced by a metal or a metallic radical. They are formed by the action of acids on metals (with the elimination of hydrogen), and on oxides and hydroxides (with the elimination of water), by the direct action of an acid with ammonia or an ammonia derivative, and in other ways. Specifically, the term salt is applied to sodium chloride, NaCl.

Saponification—Process, act, or result of hydrolysis of an ester by an inorganic base, the product being a salt and an alcohol. When the ester being saponified is an animal or vegetable fat, the products are soap and glycerol. By extension, the hydrolysis of compounds other than esters.

Saponification Number—In the analysis of fats, oils, etc., the number of milligrams of potassium hydroxide required for the complete saponification of one gram of substance.

Saturated Solution—A solution which contains at any constant temperature as much dissolved substance as it can possibly hold in presence of solid solute.

Sectile—A mineralogical term applied to minerals which are capable of being severed by the knife with a smooth cut, but yet pulverizable, as distinguished from brittle or malleable.

Shrinkage—See *metal shrinkage*.

Single Electrode Potential—See *electrode potential*.

Soap—The sodium or potassium salt of a higher molecular weight fatty acid; by extension, any salt of the fatty acids and commonly called a *metallic soap* when containing some metal other than sodium or potassium.

Solid—A part of space bounded on all sides and which does not perceptibly flow. Between typical solids and liquids are many gradations designated by terms such as *viscous solid*, *semi-solid*, *viscous liquid*, etc.

Solidification Point—The temperature at which a liquid changes into a solid. It may be identical with, or lower than, the melting point.

Solubility—The quantity of solute present in a given amount of the saturated solution, at a certain temperature, is called the solubility of the solute. It is expressed in any of the units used to express concentration of solution, such as grams of solute per 100 milliliters of solvent, grams solute per 100 grams of solution, moles of solute per liter of solution or per 1000 grams of solvent, etc.

Solubility Product—The maximum product of the ionic concentrations of a difficultly soluble salt which can exist in equilibrium with the solid phase at a definite temperature, each concentration being raised to its proper power. In general, if $A \rightleftarrows bB \times cC$ represents the equilibrium between the molecule A and its ions B and C in a saturated solution, then the solubility product K_{sp} is given by the equation: $K_{sp} = [B]^b \times [C]^c$, where $[B]$ and $[C]$ are expressed in gram-ionic weights per liter.

Solute—When a solid is dissolved in a liquid, the solid is termed the *solute*, the liquid the *solvent*. When one liquid is dissolved in a second liquid, the liquid present in the smaller amount is usually called the solute. In this case, the designation is arbitrary, particularly when the liquids are completely miscible.

Solution—A homogeneous mixture formed by the process in which a substance, whether solid, liquid, or gaseous, is mixed with a liquid (or by extension, with a solid, or gas) called the solvent. The term is usually associated with liquids but may include solids, as in alloys, or gaseous mixtures.

Solution, Heat of—The heat evolved or absorbed when a substance (solute) dissolves in a solvent. The *integral heat of solution* is the heat absorbed when one mole of solute is dissolved in a sufficient quantity of solvent to produce the specified concentration. Most values of heats of solutions are integral heats of solution of the solute in a large amount or specified amount of solution. The *differential heat of solution* is the amount

of heat absorbed when one mole of solute is dissolved in such a large volume of solution of definite concentration that the concentration of the solution is not apparently altered. The differential heat of solution is the rate of change of the integral heat of solution per mole of solute at any specified concentration.

Solvent—See *solute.*

Specific Gravity—The ratio of the weight of any volume to the weight of an equal volume of some other substance taken as the standard at stated temperatures. For solids or liquids the standard is usually water, and for gases the standard is air or hydrogen.

Specific Heat—The amount of heat required to raise a unit weight of substance one degree of temperature at either constant pressure or constant volume. It is usually expressed in calories per gram per degree Centigrade. See *heat capacity* for distinction between mean and true specific heats.

Spectrum—A series of radiant energies arranged in order of wave length; as for example, when a beam of light is subjected to dispersion and then brought to a focus to form a series of images arranged in order of their wave lengths.

Standard Solution—A solution, of accurately known or standard concentration, used as a reagent.

Sublimation—The process of passing from the solid to the gaseous state directly. There is a definite vapor or sublimation pressure for a solid at each temperature. At this pressure and temperature the gaseous and solid phases are in equilibrium. If the temperature is kept constant and the outside pressure on the system is lowered, the solid will sublime. Substances like camphor, which sublime at atmospheric pressure, have a sublimation pressure at that temperature which is greater than the atmospheric pressure.

Sublimation, Heat of—The heat evolved or absorbed in subliming a unit mass at a specified temperature.

Supersaturated Solution—A solution which contains more dissolved substance than it can normally hold at the same temperature in the presence of undissolved solute.

Surface Tension—The property, due to molecular forces, existing in the surface film of all liquids which tends to contract the volume into a form with the least surface area. The particles in the surface film are inwardly attracted thus resulting in tension.

Symbol—An arbitrary or conventional sign, such as a character, a letter, abbreviation, etc., used instead of a word or words, as in chemistry, mathematics, etc., to represent elements, operations, etc.

Tensile Strength—The greatest longitudinal stress a substance can withstand without rupture. It is usually expressed with reference to a unit cross-sectional area, as kilograms per square centimeter, or pounds per square inch, necessary to produce rupture.

Tetragonal System—One of the groups of crystalline form in which three axes are at right angles, but only two, the lateral axes, equal, as in the right square prism.

Thermal Conductivity—The quantity of heat passing in unit time through a plate of unit area and unit thickness, with a temperature differential of one degree between the faces of the plate. See special section on *heat conductivity.*

Thermal Expansion—See *expansion, coefficient of.*

Thermochemical Equation—An equation which, besides the stoichiometric chemical relationships, indicates also the energy change involved in a reaction.

Thermochemistry—That branch of chemical science concerned with the relations existing between chemical action and heat (thermal changes) which accompany chemical reactions.

Thermo (electric) Couple—Two bars or wires of dissimilar metals joined at one extremity and which develop a current (thermoelectric current) when heated.

Thermodynamics, Laws of—The laws of thermodynamics expressing certain

energy relationships which were found to be true empirically. *First law*—This law, known also as the law of the conservation of energy, states that energy can be neither created nor destroyed; when one form of energy disappears another form always appears in equivalent quantity. *Second law*– This law states that heat cannot pass spontaneously from a colder to a warmer body; when free interchange of heat takes place, it is always the hotter of two bodies which loses energy and the colder that gains energy. *Third law*—This law states that every substance has a finite positive entropy, but at absolute zero the entropy may become zero, and is zero in the case of perfect crystalline substances.

Thermoluminescence—See *luminescence.*

Thermoneutrality, Law of—The law that no thermal effect is produced when dilute solutions of neutral salts are mixed and no precipitation occurs.

Titer—The titer, as applied to solutions, is the concentration of a dissolved substance as determined by titration. The term is also applied to the minimum amount or volume required to bring about a given result in titration. The titer, as applied to fats, is the solidification point of the fatty acids liberated from a fat by hydrolysis.

Titration—A method, or the process, of using a standard solution for the determination of the amount of some substance in another solution. The known solution is usually added in a definite quantity to the unknown until equivalent quantities have been added. If the reaction in question is in itself invisible, an indicator, having a visible reaction, correlated with the invisible, is used. From the quantity of known substance added and the reaction involved the quantity of unknown substance may be calculated.

Titrimetric—A word synonymous with volumetric when used with reference to chemical titration.

Transference Number—In electrolysis, a number denoting the fraction of the total current passed through a solution of an electrolyte which any one ion carries. If n is the transference number of the anion, then $1-n$ is that of the cation.

Transition Point (or temperature)—The temperature at which two crystalline forms of a substance are in equilibrium with each other. The transition temperature changes with the pressure on the system.

Triboluminescence—See *luminescence.*

Triclinic System—One of the groups of crystalline form in which there are three unequal axes and intersections oblique, as in the oblique rhomboidal prism.

Ultimate Strength—The maximum force or load per square inch for a substance under tension.

Unsaponifiable—That portion of a fat or oil which does not react with alkali in the hydrolysis to form glycerol and fatty acid soaps.

Valence—The degree of combining power of an element or a radical. It is usually expressed by a number based upon hydrogen equal to unity. Thus when H = 1, then Na = 1, Mg = 2, PO_4 = 3.

Van't Hoff Isochore—See *reaction isochore.*

Van't Hoff's Law—The law that, when a system is in equilibrium, of the two opposed interactions the endothermic is promoted by raising the temperature, the exothermic by lowering it. It is a particular case of Le Chatelier's law (q.v.)

Vapor Density—The weight of a vapor per unit volume at any stated temperature and pressure.

Vapor Pressure—The pressure exerted by a vapor when a state of equilibrium has been reached between a liquid, solid, or solution, respectively, and its vapor, is called the vapor pressure of a liquid, solid, or solution. When the vapor pressure of a liquid exceeds that of the confining atmosphere the liquid commonly is said to be boiling. See *boiling point.*

Vaporization, Heat of—The quantity of heat required to convert a unit quantity of liquid at a definite tempera-

ture to vapor at the same temperature. It is usually expressed in calories per gram, or calories per gram-mole.

Vegetable Oil—Any oil from plant origin as distinguished from animal (origin) oil. Usually the volatile (essential) oils are not included in this classification which is primarily intended to designate the fixed oils (i.e., glyceryl esters of various fatty acids). See *oil* and *animal oil.*

Viscosity—The resistance offered by a fluid (liquid or gas) to flow. The viscosity is a characteristic property and is a measure of the combined effects of adhesion and cohesion.

Vitamin—Any one of a group of constituents of most foods in their natural state and of which very small amounts are essential for normal nutrition. See special section on *vitamins.*

Volatile Acid—In analytical chemistry, any one of those acids which can be distilled from an aqueous solution at atmospheric pressure, such as acetic, butyric, etc., in contradistinction to the fixed acids, such as tartaric, phosphoric, etc.

Volatile Matter (in coal)—The percentage of the sample which consists of combustible material which is volatile, in the absence of air, at 950° ± 20°C.

Volatile Oil—An oil which is appreciably volatile. See *essential oil.*

Volt—The unit of electromotive force. It is the difference in potential required to make a current of one ampere flow through a resistance of one ohm.

Volumetric—A measurement of, or by, volumes as with standard solutions in titrimetric analysis or with the eudiometer in gas analysis.

Volumetric Factor—See *factor.*

Watt—A unit of power. The power, P, in watts developed by an electric current of I amperes flowing under a potential drop of E volts is : $P = EI$.

Wax—Any one of a class of substances of plant or animal origin, insoluble in water, partly soluble in alcohol, ether, etc., and miscible in all proportions with oils and fats. They consist of esters and often, in addition, free fatty acids, free alcohols, and higher hydrocarbons. Usually, *true waxes* are distinguished chemically from fats (which are esters of glycerol) as consisting chiefly of esters of higher monohydroxy alcohols. Sometimes the distinction between waxes and fats is based only on physical properties, the waxes being less greasy, more brittle and harder than fats. The *mineral waxes* are substances of similar properties but of mineral origin and consist mostly of higher hydrocarbons.

Weir—A device for determining fluid flow by measurements of the depth of fluid over the crest of sill and known dimensions of the device.

X ray—Any of the radiations, similar to light radiation but of much shorter wave length, which are emitted by suddenly changing the velocity of a moving electric charge by impact of a cathode ray on a target in a vacuum tube and by the changes in the atoms of the target caused by the impact. These rays possess the peculiar properties of ionizing a gas through which they pass, of penetrating various solids, of affecting photographic plates, and of causing certain substances to fluoresce. They are also known as *Roentgen rays.*

Yield Strength—The stress at which a material exhibits a specified limiting permanent set.

DEFINITIONS OF PHARMACEUTICAL PREPARATIONS AND THERAPEUTIC TERMS

Compiled by E. H. Wirth, Ph. C., Ph. D.

Most crude drugs are not suitable for administration in their natural state being either too bulky or too nauseous. Preparations suitable for administration are therefore prepared from them by the pharmacist. Brief definitions for the more common pharmaceutical preparations are given.

Therapeutic terms are employed to designate the effect of drugs when applied as remedial agents in the treatment of disease. In the cases of drugs which are cited as illustrations, it should be especially noted that most drugs have several distinct therapeutic effects, the effect cited being but one of the several characteristic of the drug. In selecting the examples an attempt has been made to cite one or two drugs which exhibit the therapeutic effect described. In certain cases of diseases many drugs are contraindicated because of certain other therapeutic activities and for this reason the following brief description is not intended as an aid to self medication.

Aceta (Vinegars)—Liquid preparations made by extracting the drug with diluted acetic acid and filtering.

Aliments (Foods) — Substances which maintain some vital process or renew some structural material. They may be vegetable, animal, or mineral in origin and are either *oxidizable* (sugar, starch), *nitrogenous* (albumin), or *unoxidizable* (water, inorganic salts). See *restoratives*.

Alteratives—Drugs which alter or change morbid conditions by furthering metabolism or modifying nutritive processes (sarsaparilla). As most alteratives promote absorption of inflammatory deposits they are also called *resolvents* or *discutients*.

Ampullae (Ampuls)—Hermetically sealed containers filled with a sterilized medicinal liquid intended for hypodermic or intravenous injection. They are usually made of glass which should be of high quality especially in regard to its resistance to water.

Analgesics (Anodynes) — Drugs which relieve pain by either (*a*) depressing sensory nerve centers, or (*b*) impairing nerve-fiber conductility (opium, belladonna, antipyrine). See *cerebral depressants*.

Anaphrodisiacs—Substances which lessen sexual functions and appetite, by diminishing excitability of the nerves of the genital organs or by depressing the genital centers in the brain and spinal cord, or by decreasing local circulation (bromides, camphor).

Anesthetics—Drugs which reduce sensory nerve-functions until nerves cannot receive or conduct sensation. When the sensory nerve conductility is generally impaired the anesthesia is said to be *general*; when the skin's end organs are depressed the action is designated as *local* anesthesia (ether,

DEFINITIONS OF PHARMACEUTICAL PREPARATIONS AND THERAPEUTIC TERMS

chloroform; novocaine). See also *cerebral depressants*, and *sedatives*.

Anhydrotics—Drugs which check perspiration by reducing the action of the sweat glands, the excitability of the sweat centers, or the circulation in the skin (pilocarpine, belladonna).

Anodynes—See *analgesics*.

Anthelmintics—Drugs which destroy (*vermicides*) or expel (*vermifuges*) intestinal worms (vermifuges: castor oil, jalap; vermicides for: (*a*) thread worms—alum, tannin, quassia, and (*b*) round worms—santonin, chenopodium, and (*c*) tape worms (*taenifuges*)—aspidium).

Antiemetics—Drugs which lessen nausea and vomiting. If the action is a sedative one on the end organs of the gastric nerves it is said to be *local* (bismuth sub-nitrate); if the irritability of the vomiting center in the medulla is reduced the action is *general* (chloral).

Antihydrotics—See *anhydrotics*.

Antilithics—Drugs which are supposed to prevent the formation of urinary and biliary concretions in the excretory passages (alkaline salts).

Antimonial—A medicine containing the element antimony.

Antiperiodic—Drugs which prevent recurrence of certain periodic febrile diseases usually by arresting further development of successive crops of pathogenic organisms in the blood (cinchona).

Antiphlogistics—Drugs which reduce inflammation of serous membranes (mercury, opium).

Antipyretics (Febrifuges)—Drugs which reduce abnormally high body temperature. This may be accomplished either by decreasing heat production (by lessening tissue change or reducing circulation) or by increasing heat loss (by dilating skin vessels or causing perspiration) (quinine; acetanilide).

Antiscorbutic—A remedy for the treatment or prevention of scurvy (lemon juice, vitamin C).

Antiseptic—A substance which prevents or retards septic decomposition by killing bacteria or arresting their development (mercuric chloride, phenol). See *antizymotics*.

Antispasmotics—Drugs which relax spasm (belladonna, lobelia). See *cerebral excitants*.

Antitoxin—A serum employed hypodermically for the treatment or prevention of those diseases caused by bacterial toxins (diphtheria antitoxin).

Antivenin—A serum used hypodermically to counteract or neutralize snake venom.

Antizymotics—Drugs which arrest fermentation dependent upon organic ferments (enzymes) or organized ferments (yeasts, bacteria). Antizymotics are usually classified into (*a*) antiseptics, (*b*) disinfectants, and (*c*) deodorants.

Aperients—See *laxatives*.

Aphrodisiacs—Drugs which stimulate sexual appetite by acting directly or reflexly upon the cerebral or spinal genital center (strychnine, cannabis, alcohol).

Aquae (Aquae Aromaticae; Aromatic Waters)—Preparations made by impregnating distilled water with volatile substances. Aromatic waters when prepared from volatile oils are intended to be, as nearly as possible, saturated solutions. They must be clear and free from solid particles. They are prepared either by distillation or solution.

Aromatics—See *carminatives*.

Arsenicals—Medicines containing the element arsenic.

Astringents—Drugs which contract

muscular fiber by direct irritation and sometimes condense tissues by precipitating albumin and gelatin (alum, tannin).

Bougies (Pencils)—Small solid cylinders impregnated with various drugs for insertion into the urethra, uterus, or nose. They are made of gelatin, glycerogelatin, or oil of theobroma.

Cachets (Wafers; Konseals)—Various sized, concave wafers made of unleavened bread or starch paper; the cavity, formed by moistening the concave edges of two and pressing them together, containing the drug.

Capsulae (Capsules)—Various sized transparent casings (short tubes, usually with one open end fitting over that of another) of gelatin. They are either hard, or soft and elastic, and are used for the administration of nauseous or disagreeable solids or liquids.

Cardiac Depressants (Cardiac Sedatives)—Drugs which lessen the force and frequency of the heart's action and control its over-action and palpitation (aconite, veratrum viride).

Cardiac Stimulants (Cardiac or Heart Tonics)—Drugs which stimulate the cardiac muscle, slow and strengthen its contractions (digitalis).

Carminatives (Aromatics)—Drugs which expel gases from the stomach and intestines by increasing peristalsis, by stimulating the circulation, and by relaxing the pyloric and cardiac orifices (peppermint, cardamon seed).

Cataplasmata (Poultices) — Soft pasty masses for external application of moist heat, with or without the addition of active medicaments. Substances commonly employed in the preparation of poultices are bran, flaxseed meal, kaolin, glycerol, and oatmeal. Glycerol or fixed oil is added to prevent caking.

Cathartics—See *purgatives.*

Caustics—See *escharotics.*

Cerata (Cerates)—Adhesive preparations for external use containing wax which are capable of being spread at ordinary temperatures and do not melt at body temperature.

Cerebral Depressants—Drugs which lower or suspend the higher brain functions usually after a preliminary stage of excitement. Cerebral depressants or cerebral sedatives are usually classified as follows: (*a*) narcotics; (*b*) hypnotics; (*c*) analgesics; and (*d*) anesthetics; see these latter terms.

Cerebral Stimulants (Cerebral Excitants; Antispasmotics)—Drugs which increase the functional activity of the brain without causing subsequent depression of the cerebral functions (caffeine, valerian).

Cholagogue—See *purgatives.*

Ciliary Excitants — Drugs, which when dissolved in the saliva, increase bronchial mucous expectoration, usually through reflex action on the bronchial and tracheal cilia (ammonium chloride, acacia).

Clysters—*See enemata.*

Collodia (Collodions)—Preparations for external use, either simple collodion (a solution of nitrocellulose in ether or alcohol), or simple collodion containing active medicinal substances. They form a protective film over the skin due to the rapid evaporation of the solvent.

Counter-irritants—These are irritants which when applied to the skin are used to produce reflex action on remote parts. See *irritants.*

Decocta (Decoctions) — Aqueous solutions of vegetable drugs prepared by boiling for 15 minutes in a closed vessel, allowing to cool, and expressing and straining. They are usually prepared in 5% concentrations.

Demulcents—Substances intended to soothe the parts to which they are

DEFINITIONS OF PHARMACEUTICAL PREPARATIONS AND THERAPEUTIC TERMS

applied, usually mucous membranes (acacia).

Dental Anodynes—Drugs used locally in toothache due to caries (oil of cloves, phenol).

Dentifricia (Dentifrices; Tooth Powders)—Finely powdered drugs, usually antiseptic, antacid, non-irritating, non-gritty, saponaceous, sweetened and flavored.

Deodorants—Substances which destroy foul odors. They may be volatile and act chemically on the obnoxious gases (chlorine) or non-volatile and act by condensing or decomposing the odoriferous substance (charcoal, potassium permanganate). See *antizymotics*.

Depresso-motors—See *motor depressants*.

Diaphoretics (Sudorifics)—Drugs which cause secretion of sweat. They may be (*a*) simple; i.e., enter the circulation and stimulate the suderiferous glands by which they are eliminated (pilocarpus); (*b*) nauseating; i.e., relax and dilate the superficial capillaries (ipecac, tartar emetic); or (*c*) refrigerant; i.e., reduce circulation by acting on the sweat centers in the medulla (potassium citrate).

Digestive Acids—Drugs which check all glandular acid secretion thus increasing alkaline secretion (dilute mineral acids). See *restoratives*.

Digestive Ferments—Enzymes aiding digestion (pepsin, diastase). See *restoratives*.

Discutients—See *alteratives*.

Disinfectants—Substances which destroy specific germs, etc. They may react by (*a*) acting as oxidizing agents; (*b*) combining with albumin; (*c*) chemically combining to form substitution compounds; (*d*) arresting molecular changes; and (*e*) altering the reaction of the media (potassium permanganate, mercuric chloride, chlorine, sulfur dioxide, chlorinated lime). See *antizymotics*.

Diuretics—Drugs which increase renal secretion. They act by (*a*) raising the local or general blood pressure; (*b*) stimulating the nerves or secreting cells of the kidneys; or (*c*) mechanically washing out of the kidneys with a large volume of water. They may be classified into (*a*) refrigerants—which excite the renal epithelium (potassium acetate); (*b*) hydragogue—which increase the amount of water in the urine owing to a local or general raising of the blood pressure (spirit of ethyl nitrite, digitalis); (*c*) stimulant—which act directly on the renal tissue (buchu, juniper, uva-ursi).

Ecbolics (Oxytocics)—Drugs which stimulate the muscular fibers of the gravid uterus to contraction, thus causing premature birth or abortion (ergot, cottonroot-bark).

Elixira (Elixers)—Sweet, aromatic, hydro-alcoholic, medicated liquids. The alcoholic strength varies between 20 and 25%.

Emetics—Drugs which cause vomiting. The action may be local; i.e., by the irritation of the end organs of the gastric, pharyngeal or esophageal nerves by reflex action (zinc sulfate); or systematic; i.e., by stimulating the vomiting centers directly through the circulation (apomorphine, ipecac).

Emmenagogues—Drugs which restore the menstrual function, either by stimulating directly the uterine muscular fiber (ergot), or indirectly by enriching the blood and thus toning up the nervous system (quinine, iron).

Emollients—Substances which soften and relax the tissues when applied locally. They diminish tension and pressure on the nerves, dilate the vessels and protect inflamed surfaces. They are usually applied to the skin (fixed oils).

Emplastra (Plasters)—Substances, solid at ordinary temperatures but

pliable and adhesive at body temperature. They are intended for external application. They may or may not be spread.

Emulsa (Emulsions) — Aqueous milk-like mixtures of oils, fats or resins in a minutely divided state, suspended by mucilaginous materials.

Enemata (Enemas)—Liquids intended for injection into the rectum.

Epispastics—See **vesicants.**

Errhines—See **sternutatories.**

Escharotics (Caustics)—Substances which destroy tissue either by abstraction of water, combining with the albumin of the skin, or by corrosive deoxidation of the tissues, thus causing slough (mineral acids, sodium hydroxide, phenol). See *irritants.*

Excito-motors—See *motor excitants.*

Expectorants—Drugs which change the broncho-pulmonary mucous membrane secretion promoting its expulsion (ammonium chloride, senega, squill).

Extracta (Extracts)—Pasty or semi-solid masses, or dry, solid or powdered products prepared by exhausting organic drugs with appropriate solvents and then carefully evaporating the solutions. Pasty or semi-solid extracts are usually referred to as *pilular extracts.*

Febrifuges—See **antipyretics.**

Ferments—See *digestive ferments.*

Fluidextracta (Fluidextracts) — Concentrated liquid preparations made from organic drugs by extracting with suitable solvents. The activity of one cubic centimeter of the fluid extract is adjusted to equal that of one gram of the drug. Various menstrua are employed, generally mixtures of alcohol and water, or mixtures of alcohol and water with glycerol or acids.

Foods—See *aliments*; *restoratives.*

Galactagogues—Drugs which increase lacteal secretion (pilocarpine, alcohol).

Gargarismata (Gargles)—Fluid preparations intended for gargling.

Germicides—See *parasiticides.*

Glycerita (Glycerites)—Solutions of a drug in glycerol; usually intended for external use.

Hematinics—Drugs which increase the amount of hematin in the blood (iron salts, chalybeate waters).

Hemostatics—Substances which arrest hemorrhage (bleeding). Some authorities consider the word synonymous with styptics, others consider the word hemostatic as limited to those substances which are for internal application (ergot, ceanothus), whereas styptic signifies external use (alum, ferric chloride).

Honeys—See *mellita.*

Hormone—A chemical secretion from a gland which by passage through the blood stream stimulates the activity of another organ.

Hydragogue—See *diuretic, purgatives.*

Hypnotics (Sonnificants; Soporifics)—Drugs which produce sleep leaving undisturbed the normal relationship of the mental faculties to the external world. In a broad sense these may be considered to include narcotics and anesthetics (chloral hydrate, sulfonal). See *cerebral depressants.*

Hypodermic—A subcutaneous (beneath the skin) injection.

Infusa (Infusions)—Aqueous solutions of vegetable drugs prepared by adding boiling water to the drug in a closely-covered container and allowing to stand for half an hour, then straining and expressing. They are usually prepared in a 5% concentration.

Irritants (Counter-irritants)—Sub-

stances which when applied to the skin cause vascular excitement. They are called *counter-irritants* if they are used to promote reflex action on remote parts. Irritants are usually classified as (*a*) rubifacients, (*b*) vesicants, (*c*) pustulants, and (*d*) escharotics. See these latter terms.

Juices—See *succi.*

Konseals—See *cachets.*

Laxatives (Aperients)—Purgatives which excite moderate peristalsis giving soft movements without irritation (magnesia). See *purgatives.*

Linimenta (Liniments)—Solutions or mixtures for external application usually by rubbing. They usually contain fixed or volatile oils.

Liquores (Liquors)—Aqueous solutions of non-volatile substances, usually inorganic compounds.

Lithotriptics—Drugs supposedly dissolving or causing the excretion of urinary and biliary concretions (urates: alkaline salts; calcium oxalate: acids, carbonated waters; phosphatic deposits: ammonium benzoate).

Lozenges—See *trochisci.*

Magmae—Suspensions of finely divided insoluble substances in water usually produced by chemical reaction. The suspensions are fairly stable and are often known as *milks.*

Massae (Masses)—Pill masses preserved in bulk, to be used when required.

Medicated Pencils—See *stili medicamentorum.*

Mellita (Honeys)—Mixtures of medicinal substances with clarified honey.

Misturae (Mixtures)—Liquid preparations of insoluble, suspended, active substances, or solutions containing more than one liquid of medicinal activity.

Motor Depressants (Depresso-motors)—Drugs which lower the functional activity of the motor apparatus and spinal cord (amyl nitrite, gelsemium).

Motor Excitants (Excito-motors; Spinants)—Drugs which increase the functional activity of the motor apparatus and spinal cord (nux-vomica, picrotoxin).

Mucilagines (Mucilages)—Saturated aqueous liquids, either adhesive or jelly-like, prepared from gums or starch.

Mydriatics—Drugs which dilate the pupil of the eye (atropine).

Myotics—Drugs which contract the pupil of the eye (pilocarpine).

Narcotics—Drugs which first excite and stimulate all body functions, then cause profound sleep, stupor, coma, insensibility and may cause death by paralyzing the medulla centers governing respiration and other vital functions (opium, cannabis). See *cerebral depressants.*

Nebulae (Sprays)—Aqueous or oily (light liquid petrolatum) solutions to be used in an atomizer for nares and throat.

Ointments—See *unguenta.*

Olea (Oils)—Fixed or volatile oils, the former obtained by expression and the latter by distillation.

Oleata (Oleates)—Solutions of medicinals in oleic acid, usually intended for external application.

Oleoresinae (Oleoresins)—Natural solutions of resins in volatile oils, occurring as such in plants.

Oxytocics—See *ecbolics.*

Parasiticides (Germicides)—Substances which kill animal and vegetable parasites (mercuric chloride, phenol).

DEFINITIONS OF PHARMACEUTICAL PREPARATIONS AND THERAPEUTIC TERMS

Pastilles—See *trochisci.*

Pencils—See *bougies.*

Pilulae (Pills)—Solid bodies, usually spherical or oval, containing medicinal substances, and intended to be swallowed whole. They may be uncoated or coated with various substances (gelatin, sucrose, cacao, tolu, etc.) to mask unpleasant taste. If it is desired that the pill pass unchanged through the stomach and be dissolved in the intestine, it is coated with keratin or salol. Such a coating is known as an *enteric* coating.

Plasters—See *emplastra.*

Poultices—See *cataplasmata.*

Prophylactics—Substances administered to prevent disease (diptheria antitoxin).

Protectives—Substances used as mechanical coverings to protect various injured parts from air, water, and friction (collodion).

Pulmonary Sedatives—Drugs which lessen the irritability of the respiratory nerves or center, thereby diminishing cough and dyspnea. They may depress the center, remove irritating substances from the passages, lessen local congestion, or lower excitability of the vagus end-organs and afferent filaments of the respiratory tract (morphine, codeine, hydrogen cyanide).

Pulveres (Powders)—Finely powdered drugs or mixtures of the same, frequently consisting in part of some suitable diluent.

Purgatives (Cathartics) — Drugs which increase or hasten intestinal evacuations. They are usually classified as follows: (*a*) *laxatives*; (*b*) *simple purgatives*, which cause active peristalsis and stimulate secretion of the intestinal glands, giving one or more copious, semi-fluid movements accompanied by some irritation and griping (aloe, castor oil); (*c*) *saline purgatives*, which stimulate intestinal glands, increase peristalsis and osmosis, causing watery stools (magnesium sulfate); (*d*) *drastic purgatives*, which cause violent peristalsis, watery stools, griping and irritation (jalap, colocynth; (*e*) *hydragogue cathartics*, which remove much water from the vessels causing watery stools (croton oil, elaterinum); (*f*) *cholagogue purgatives*, which stimulate the flow of bile causing free purgation of green colored (bilious), liquid stools (aloe, mercurials).

Pustulants—Drugs which cause blisters. See *irritants.*

Refrigerants—Drugs which allay thirst, giving the sensation of coolness (diluted vegetable and mineral acids).

Resolvents—See *alteratives.*

Respiratory Sedatives (Depressants)—Drugs which lower the activity of the respiratory center resulting in shallow and slow respirations (aconite, physostigma).

Respiratory Stimulants — Drugs which stimulate the respiratory center resulting in deeper and quicker breathing (strychnine, digitalis).

Restoratives—Substances which give strength and vitality. Restoratives are classified into (*a*) foods, (*b*) digestive ferments, (*c*) digestive acids, (*d*) fats, (*e*) hematinics, and (*f*) tonics. See these latter terms.

Rubefacients—Substances which produce temporary redness and skin congestion. If left too long the action may become vesicant or even escharotic (mustard).

Sedatives—In general, drugs which allay nervous irritation and irritability. Synonymous with cerebral depressants. See *pulmonary sedatives.*

Semi-alteratives (Alkalis)—Drugs which stimulate acid secretions and check alkaline secretions (carbonates).

Sialagogues—Substances which promote the secretion and flow of saliva

DEFINITIONS OF PHARAMACEUTICAL PREPARATIONS AND THERAPEUTIC TERMS

and buccal mucous (capsicum, physostigma).

Somnificants—See *hypnotics.*

Soporifics—See *hypnotics.*

Species (Teas)—Mixtures of cut or bruised vegetable drugs from which teas can be made.

Spinants—See *motor excitants.*

Spiriti (Spirits)—Solutions of volatile substances in alcohol or diluted alcohol.

Sprays—See *nebulae.*

Sternutatories—Drugs which cause sneezing. When used to increase nasal secretion by applying to the mucous membrane of the nose they are usually referred to as *errhines* (ipecac, cubeb).

Stili Medicamentorum (Medicated Pencils)—Medicinal agents made into a plastic mass and rolled into cylinders for external application.

Styptics—See *hemostatics.*

Succi (Juices)—Expressed vegetable juices usually preserved by the addition of alcohol.

Sudorifics—See *diaphoretics.*

Suppositoria (Suppositories) — Solids of various shapes: cone-shaped, pencil-shaped, globular, or oviform, which contain medicines and melt when inserted into the rectum, nares, urethra, or vagina. They are usually made from oil of theobroma, glycerinated gelatin, or sodium stearate.

Syrupi (Syrups) — Concentrated aqueous solutions of sucrose containing either medicinal agents or flavoring agents.

Tabellae (Tablets)—Solid disk-like lenticular bodies made by compression. *Tablet triturates* are prepared by triturating drugs and then moulding; lactose is usually employed as the diluent. See also *trochisci* and *toxitabellae.*

Taenifuges—See *anthelmintics.*

Teas—See *species.*

Tincturae (Tinctures) — Alcoholic solutions of drugs, prepared either by maceration, percolation, or solution. The alcoholic strength is variable and the drugs generally used are non volatile. The drug strength, where the drug is potent, is usually 10%. Where the drug is not very potent the strength is usually 20%.

Tonics—Drugs which improve the tone of specific tissues by stimulating vital functions (mineral: phosphates; vegetable: gentian). See *restoratives.*

Toxitabellae (Poison Tablets)—These are tablets of angular shape (not discoid) each having the word "poison" and the skull and cross bones distinctly stamped upon it. The purpose of the distinctive shape and marking is to diminish poisoning by their accidental ingestion. The common one is corrosive sublimate.

Trochisci (Troches)—Solid, round, oval, or flat masses composed of medicinal agents combined with sugar or extract of licorice, massed with mucilage of tragacanth, flavored, and dried. They are also called *lozenges.* In England they are called *tablets* and are of a definite weight and have a chocolate base; *pastilles* (in England) have a glyco-gelatin base.

Unguenta (Ointments)—These are soft or solid fatty preparations for external use, liquifying when applied to the skin and containing medicaments in a base of benzoinated lard, petrolatum, wool fat, prepared suet, expressed oil of almond, wax, spermaceti, paraffin, etc. They are also called *salves.*

Vermicides—See *anthelmintics.*

Vermifuges—See *anthelmintics.*

DEFINITIONS OF PHARMACEUTICAL PREPARATIONS AND THERAPEUTIC TERMS

Vesicants (Epispastics)—Substances which produce much inflammation of the skin with the effusion of serum between the epidermis and the derma (cantharides, volatile oil of mustard). See *irritants*.

Vina (Wines)—Liquids differing from tinctures in that the drug is extracted with white wine. The alcoholic content varies between 7 and 12%.

Vinegars—See *aceta*.

Wafers—See *cachets*.

Wines—See *vina*.

MEDICAL PRESCRIPTION NOTATION

1 drachm	... ℥ i, or ℥ j.	4 "	... gr. iv.
1½ "	... ℥ iss.	8 "	... gr. viii. or gr. viij.
2 "	... ℥ ii, or ℥ ij.	½ ounce	... ℥ ss.
3 "	... ℥iii, or ℥ iij.	1 "	... ℥ i, or ℥ j.
3½ "	... ℥ iiiss.	1½ "	... ℥ iss.
1 gallon	... Ci or Cj.	½ pint	... Oss.
½ grain	... gr. ss.	1 "	... Oi or Oj.
1 "	... gr. j, or gr. i.	½ scruple	... ℈ ss.
1½ "	... gr. iss.	1 "	... ℈ i. or ℈ j.
2 "	... gr. ii, or gr. ij.	1½ "	... ℈ iss.
2½ "	... gr. iiss.	2 "	... ℈ ii, or ℈ ij.

℞ (L. *recipe*, take)—A symbol placed at the beginning of a prescription. It is supposed to have been originally ♃, the symbol of Jupiter, serving as an invocation to this king of the gods that the compound might act beneficially.

PHYSIOLOGICAL RESPONSE TO VARIOUS CONCENTRATIONS OF SOME COMMON GASES AND VAPORS

Reproduced from "Dow Calcium Chloride for Refrigeration," copyright 1929 by The Dow Chemical Co., by permission.

PHENOL COEFFICIENTS

Phenol coefficient determinations as usually performed do not always give a true indication of the value of a germicide in actual use. Organisms dried on various surfaces should also be exposed to the action of the germicide in order to test practical effectiveness and Shippen[7] subcultures should be made. Many antiseptics inhibit growth rather than kill. This is well known in the case of mercurials.[6]

PHOTOGRAPHIC FORMULAS

The purest water, preferably distilled, should be used for making all photographic solutions. Dissolve all chemicals in the order given. Do not add the next chemical until the last is completely dissolved. Use judgment in the warming of solutions during the dissolving of chemicals. Slightly warm water will produce prompt dissolving, but too much heat may cause reactions to occur which will destroy the value of the solution.

Throughout this table all references to sodium sulfite and sodium carbonate indicate the desiccated or anhydrous salt. If monohydrated or crystalline salt is used, increase the amount by 17 per cent for the monohydrated salt or double the amount for the crystalline form. In some formulas a proprietary alkali known as "Kodalk" is used. These formulas are designated by the letters "DK" before the formula number.

In most cases the manufacturer now encloses with each package of film, plates or paper a group of formulas which have been tested and found to give the best results for that particular product. Whenever such information is available, the user should not hesitate to take advantage of it, as it is to the manufacturer's advantage to have his customers obtain the best possible results with his product.

Many manufacturers of sensitized materials make available the most useful of their formulas in prepared form for large and smaller users. All the photographer needs to do is to dissolve the powders in the proper volume of water as directed in the instructions printed on the package, in order to have the best possible formula for his particular job. This method is especially recommended for people doing only occasional photographic processing since each batch is fresh when used and, because of the small volumes available, it is not necessary to save solutions in the interest of economy. This method also eliminates the necessity of maintaining large stocks of the individual chemicals necessary.

DEVELOPERS

Fine Grain (Kodak DK-20)

	Avoirdupois	Metric
Water, about 125°F. (50°C.)	96 ounces	750.0 c.c.
Elon	290 grains	5.0 grams
Sodium Sulfite, desiccated	13¼ ounces	100.0 grams
Kodalk	116 grains	2.0 grams
Sodium Thiocyanate (Sulfocyanate)	58 grains	1.0 gram
Potassium Bromide	29 grains	0.5 gram
Cold water to make	1 gallon	1.0 liter

Dissolve chemicals in the order given.

Time of development, 15 to 25 minutes in a tank at 65°F. (18°C.) according to the contrast desired. Decrease the time about 20% for tray use. Develop underexposures fully for best results.

High Contrast (Kodak D-19)

STOCK SOLUTION

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	64 ounces	2.0 liters
Elon	128 grains	8.8 grams
Sodium Sulfite, desiccated	12 ozs. 360 grains	384.0 grams
Hydroquinone	1 oz. 75 grains	35.2 grams
Sodium Carbonate, desiccated	6 ozs. 180 grains	192.0 grams
Potassium Bromide	290 grains	20.0 grams
Cold water to make	1 gallon	4.0 liters

Dissolve chemicals in the order given.

Use without dilution. Develop 3 to 6 minutes in a tray at 65°F. (18°C.) according to the contrast desired. Increase the time about 25% for tank development.

For infrared landscape photography, dilute as follows: stock solution 1 part, water 4 parts. Develop about 5 minutes at 65°F. (18°C.).

This developer may also be used for x-ray films and in most cases where high contrast is desired.

PHOTOGRAPHIC FORMULAS

Low Contrast (Kodak D-76)

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	96 ounces	3.0 liters
Elon	116 grains	8.0 grams
Sodium Sulfite, desiccated	13¼ ounces	400.0 grams
Hydroquinone	290 grains	20.0 grams
Borax, granular	116 grains	8.0 grams
Water to make	1 gallon	4.0 liters

Dissolve chemicals in the order given.

Develop amateur roll films and acro films about 20 minutes in a tank or 16 minutes in a tray of fresh developer at 65°F. (18°C.).

Develop professional films and plates 10 to 25 minutes in a tank at 68°F. (18°C.) according to the contrast desired. For tray use, decrease the time about 20%. This developer gives greatest shadow detail on fine grain panchromatic films.

A faster working developer can be obtained by increasing the quantity of borax. A still more active developer can be obtained by replacing the borax by Kodalk.

The developer may become slightly muddy due to the formation of a suspension of colloidal silver but this is harmless and can be ignored.

For duplicate negative film, average time of development is 6 to 9 minutes at 65°F. (18°C.).

Extreme Contrast (Kodak D-8)

STOCK SOLUTION

	Avoirdupois	Metric
Water	96 ounces	3.0 liters
Sodium Sulfite, desiccated	12 ounces	360.0 grams
Hydroquinone	6 ounces	180.0 grams
Sodium Hydroxide (Caustic Soda)	5 ounces	150.0 grams
Potassium Bromide	4 ounces	120.0 grams
Water to make	1 gallon	4.0 liters

Dissolve chemicals in the order given. Stir the solution thoroughly before use.

For use, take 2 parts of stock solution and 1 part of water. Develop about 2 minutes in a tray at 65°F. (18°C.). This formula is especially recommended for making line and half-tone screen negatives for printing directly on metal.

A formula which is slightly less alkaline and gives almost as much density can be obtained by using 3¾ ounces of sodium hydroxide per gallon of stock solution (112 grams per 4 liters) instead of the quantity given in the formula.

General Elon-Hydroquinone (Kodak D-61a)

STOCK SOLUTION

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	16 ounces	500.0 c.c.
Elon	45 grains	3.1 grams
Sodium Sulfite, desiccated	3 ounces	90.0 grams
Sodium Bisulfite	30 grains	2.1 grams
Hydroquinone	85 grains	5.9 grams
Sodium Carbonate, desiccated	165 grains	11.5 grams
Potassium Bromide	24 grains	1.7 grams
Cold water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

For *tray* use take 1 part of stock solution to 1 part of water. Develop for about 7 minutes at 65°F. (18°C.)

For *tank* use take 1 part of stock solution and 3 parts of water. At a temperature of 65°F. (18°C.), the development time is about 14 minutes. It is advisable to make up a greater quantity than is needed to fill the tank. If the developer in the tank is of normal strength, but the volume of solution has been reduced, add a sufficient quantity of the surplus solution diluted 1:3 to fill the tank.

PHOTOGRAPHIC FORMULAS

Photomicrographic Low and Medium Contrast (D-76c)

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	96 ounces	3.0 liters
Elon	116 grains	8.0 grams
Sodium Sulfite, desiccated	13¼ ounces	400.0 grams
Hydroquinone	290 grains	20.0 grams
Borax, granular	116 grains	8.0 grams
Potassium Iodide, 1% solution	1 dram	4.0 c.c.
Potassium Bromide, 2.5% solution	10 drams	40.0 c.c.
Cold water to make	1 gallon	4.0 liters

Dissolve chemicals in the order given.

Use without dilution.

For low contrast, develop about 5 minutes, and for normal contrast, about 6½ minutes, at 65°F. (18°C.) in a tray of fresh developer. Increase the time about 25% for tank development.

Photomicrographic High Contrast (D-19) See formula D-19 given previously.

Tropical Non-blistering (Kodak DK-15)

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	24 ounces	750.0 c.c.
Elon	82 grains	5.7 grams
Sodium Sulfite, desiccated	3 ounces	90.0 grams
Kodalk (Potassium Metaborate)	¾ ounce	22.5 grams
Potassium Bromide	27 grains	1.9 grams
* Sodium Sulfate, desiccated	1½ ounces	45.0 grams
Cold water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

Average time for tank development is 9 to 12 minutes at 65°F. (18°C.) and 2 to 3 minutes at 90°F. (32°C.), in the fresh developer according to the contrast desired. When working *below* 75°F. (24°C.) the sulfate may be omitted if a more rapid formula is required. Development time *without* the sulfate is 5 to 7 minutes at 65°F. (18°C.). Develop about 20 per cent less for tray use.

When development is completed rinse the film or plate in water for 1 or 2 seconds only and immerse in the Tropical Hardener (Formula SB-4) for 3 minutes (omit water rinse if film tends to soften); then fix for at least 10 minutes in an acid hardening fixing bath, such as Formula F-5, and wash for 10 to 15 minutes in water (not over 95°F.) (35°C.).

Further details on tropical development will be found in the booklet "Tropical Development" obtainable on request from the Eastman Kodak Co., Rochester, N. Y.

Infrared Medium Contrast (D-76) See formula D-76 given previously.

Infrared High Contrast (D-19) See formula D-19 given previously.

Lantern Slide (Kodak D-32)

STOCK SOLUTION A

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	16 ounces	500.0 c.c.
Sodium Sulfite, desiccated	90 grains	6.3 grams
Hydroquinone	100 grains	7.0 grams
Potassium Bromide	50 grains	3.5 grams
Citric Acid	10 grains	0.7 gram
Cold water to make	32 ounces	1.0 liter

STOCK SOLUTION B

Cold water	32 ounces	1.0 liter
Sodium Carbonate, desiccated	1 ounce	30.0 grams
Sodium Hydroxide (Caustic Soda)	60 grains	4.2 grams

* If it is desired to use crystalline sodium sulfate instead of the desiccated sulfate then 3½ ounces per 32 ounces (105 grams per liter) should be used.

PHOTOGRAPHIC FORMULAS

Dissolve chemicals in the order given.

For use, take 1 part of A and 1 part of B. For warmer tones, 1 part of A and 2 parts of B.

Develop about 5 minutes at 70°F. (21°C.).

Oscillograph, Cardiograph, and other line record materials.

See high contrast developer formula D-19 given previously.

Universal Paper (Kodak D-72)

STOCK SOLUTION

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	16 ounces	500.0 c.c.
Elon	45 grains	3.1 grams
Sodium Sulfite, desiccated	1½ ounces	45.0 grams
Hydroquinone	175 grains	12.0 grams
Sodium Carbonate, desiccated	2¼ ounces	67.5 grams
Potassium Bromide	27 grains	1.9 grams
Water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

For chloride papers take stock solution 1 part, water 2 parts. Develop 45 seconds at 70°F. (21°C.).

For bromide papers take stock solution 1 part, water 4 parts. Develop not less than 1½ minutes at 70°F. (21°C.).

For lantern slides take stock solution 1 part, water 2 parts. Develop 1 to 2 minutes at 70°F. (21°C.). For greater contrast dilute 1:1 and for less contrast dilute 1:4.

Warm Tone Paper (Kodak D-52)

STOCK SOLUTION

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	16 ounces	500.0 c.c.
Elon	22 grains	1.5 grams
Sodium Sulfite, desiccated	¾ ounce	22.5 grams
Hydroquinone	90 grains	6.3 grams
Sodium Carbonate, desiccated	½ ounce	15.0 grams
Potassium Bromide	22 grains	1.5 grams
Cold water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

For professional contact papers, use stock solution 1 part, water 1 part.

For professional enlarging papers and bromide papers, use full strength solution.

Develop all papers not less than 1½ minutes at 70°F. (21°C.).

FIXING BATHS

Acid Hardening (Kodak F-5)

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	20 ounces	600.0 c.c.
Sodium Thiosulfate (Hypo)	8 ounces	240.0 grams
Sodium Sulfite, desiccated	½ ounce	15.0 grams
*Acetic Acid (28% pure)	1½ fluid ozs.	48.0 c.c.
**Boric Acid, crystals	¼ ounce	7.5 grams
Potassium Alum	½ ounce	15.0 grams
Cold water to make	32 ounces	1.0 liter

Dissolve the hypo in the specified volume of water (about 125°F.) (52°C.) and then add the remaining chemicals in the order given, taking care that each chemical is dissolved before adding the next. Then dilute with water to the required volume.

The F-5 fixing bath has the advantage over the older type of fixing baths, which do not contain boric acid, in that it gives much better hardening and has a lesser tendency to precipitate a sludge of aluminum sulfite throughout its useful life.

* To make 28% acetic acid from glacial acetic acid, dilute three parts of glacial acetic acid with eight parts of water.

** Crystalline boric acid should be used as specified. Powdered boric acid dissolves only with great difficulty, and its use should be avoided.

PHOTOGRAPHIC FORMULAS

Non-hardening (Kodak F-24)

	Avoirdupois	Metric
Water (about 125°F.) (50°C.)	16 ounces	500.0 c.c.
Sodium Thiosulfate (Hypo)	8 ounces	240.0 grams
Sodium Sulfite, desiccated	145 grains	10.0 grams
Sodium Bisulfite	365 grains	25.0 grams
Cold water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

This bath is recommended for films, plates or paper when no hardening is desired. It may be used satisfactorily only in case the temperature of the developer, rinse bath, and wash water is not higher than 65°F. (18°C.), and provided ample drying time is allowed so that relatively cool drying air can be used.

MISCELLANEOUS

Acid Rinse Bath (Kodak SB-1); Short Stop

	Avoirdupois	Metric
Water	32 ounces	1.0 liter
*Acetic Acid (28% pure)	1½ fluid ozs.	48.0 c.c.

Rinse prints for at least 5 seconds.

With a 1 to 2 second drain, the equivalent of approximately twenty-five 8 by 10 prints may be processed by 1 quart (1 liter) of this bath before it becomes alkaline and should be discarded.

Hardener-Rinse Bath (Kodak SB-3)

	Avoirdupois	Metric
Water	32 ounces	1.0 liter
Potassium Chrome Alum	1 ounce	30.0 grams

This bath is intended for use in hot weather after development and before fixation in conjunction with formula F-5.

Agitate the negatives for several seconds when first immersed in the hardener and allow to remain in the solution for 3 to 5 minutes to secure maximum hardening.

IMPORTANT: The bath should be renewed frequently and if there is any tendency for scum to form on the films, it should be removed by swabbing with cotton. The bath should be skimmed each day before use.

Intensifier (Kodak IN-4)

STOCK SOLUTION	Avoirdupois	Metric
Potassium Bichromate	3 ounces	90.0 grams
Hydrochloric Acid, C. P.	2 fluid ozs.	64.0 c.c.
Water to make	32 ounces	1.0 liter

For use, take 1 part of stock solution to 10 parts of water.

Harden the negative with an alkaline solution of formalin (Formula SH-1) before treatment with the chromium intensifier, or the gelatin may reticulate and ruin the negative.

Bleach thoroughly at 65°F. (18°C.), then wash five minutes and redevelop fully (about 5 minutes) in artificial light or daylight (not sunlight) in any quick-acting, non-staining developer containing the normal proportion of bromide, such as Formula D-72, diluted 1:3. If the negative is not redeveloped fully then fix for five minutes, and wash thoroughly. Fixing is unnecessary if redevelopment is thorough. The degree of intensification may be controlled by varying the time of redevelopment. Greater intensification can be secured by repetition.

Warning: Developers containing a high concentration of sulfite, such as Formula D-76, are not suitable for redevelopment, since the sulfite tends to dissolve the bleached image before the developing agents have time to act on it.

Negatives intensified with chromium are more permanent than those intensified with mercury.

* To make 28% acetic acid from glacial acetic acid dilute three parts of glacial acetic acid with eight parts of water.

PHOTOGRAPHIC FORMULAS

The Eastman Chromium Intensifier Powders are equally as satisfactory as Formula In-4, and are supplied in prepared form ready to use simply by dissolving in water.

Reducer (Kodak R-4a)

STOCK SOLUTION A

	Avoirdupois	Metric
Potassium Ferricyanide	1¼ ounces	37.5 grams
Water to make	16 ounces	500.0 c.c.

STOCK SOLUTION B

Sodium Thiosulfate (Hypo)	16 ounces	480.0 grams
Water to make	64 ounces	2.0 liters

For use take: Stock Solution A, 1 ounce (30 c.c.), stock solution B, 4 ounces (120 c.c.), and water to make 32 ounces (1 liter). Add A to B, then add the water.

Pour the mixed solution at once over the negative to be reduced. Watch closely. The action is best seen when the solution is poured over the negative in a white tray. When the negative has been reduced sufficiently, wash thoroughly before drying.

Solutions A and B should not be combined until they are to be used. They will not keep long in combination.

Hand Stain Remover (Kodak S-5)

SOLUTION NO. 1

	Avoirdupois	Metric
Potassium Permanganate	¼ ounce	7.5 grams
Water	32 ounces	1.0 liter

SOLUTION NO. 2

Sodium Bisulfite	16 ounces	480.0 grams
Water	32 ounces	1.0 liter

Rub the hands with a small amount of the No. 1 solution, rinse in water; then rinse with the No. 2 solution which will remove the stains.

Tray Cleaner (Kodak TC-1)

	Avoirdupois	Metric
Water	32 ounces	1.0 liter
Potassium Bichromate	3 ounces	90.0 grams
Sulfuric Acid, C.P.	3 fluid ozs.	96.0 c.c.

Add the sulfuric acid slowly while stirring the solution rapidly.

For use, pour a small volume of the tray cleaner solution in the vessel to be cleaned. Rinse around so that the solution has access to all parts of the tray; then pour the solution out and wash the tray six or eight times with water until all traces of the cleaning solution disappear.

Desensitizer

In the development of panchromatic emulsions it is necessary to work in absolute darkness, or with the very dense panchromatic safelight. When visual control of development is necessary, Pinacryptol Green is used as a desensitizer. Two methods are available for using this material, namely in a preliminary bath, or mixed with the developing solution. As it is sometimes necessary to change the method used, it has been found best to make up a stock solution of the following proportions:

Pinacryptol Green	1 part
Water	500 parts

To use this solution as a separate preliminary bath, the stock solution is diluted 10 times, making a solution of 1 in 5000 in the tray. If the desensitizer is to be used in the developer, the stock solution is added in the ratio of 1 ounce of solution to every 10 ounces of developer. After the film has been immersed in the solution a minute, the red light may be turned on, but to be absolutely safe it is best to use a strong green light.

Special Formalin Hardener (Kodak SH-1)

Formalin (37% formaldehyde solution)	2½ drams	10.0 c.c.
Sodium Carbonate	73 grains	5.0 grams
Water to make	32 ounces	1.0 liter

PHOTOGRAPHIC FORMULAS

This formula is recommended for the treatment of negatives which would normally be softened considerably by a chemical treatment in the removal of several types of stains, or by intensification or reduction.

After treatment for 3 minutes in the hardening solution, films or plates should always be rinsed and immersed for 5 minutes in a fresh acid fixing bath and well washed before giving any further chemical treatment.

Tropical Hardener (Kodak SB-4)

This solution is recommended for use in conjunction with the Tropical Developer (Formula DK-15), when working above 75°F. (24°C.).

	Avoirdupois	Metric
Water	32 ounces	1.0 liter
Potassium Chrome Alum	1 ounce	30.0 grams
*Sodium Sulfate, desiccated	2 ounces	60.0 grams

Agitate the negatives for 30 to 45 seconds when first immersing in the hardener, or streakiness will result. Leave them in the bath for at least 3 minutes between development and fixation. If the temperature of the developer is below 85°F. (29°C.) rinse for 1 to 2 seconds in water before immersing in the chrome alum hardener bath. The hardening bath is a violet blue color by tungsten light when freshly mixed, but it ultimately turns a yellow-green with use; it then ceases to harden and should be replaced with a fresh bath. The hardening bath should never be overworked. An unused bath will keep indefinitely, but the hardening properties of a partially used bath fall off rapidly on standing for a few days.

Chrome Alum-Bisulfite Hardener

	Avoirdupois	Metric
Water	1 pint	500 c.c.
Potassium Chrome Alum	150 grains	10 grams
Sodium Bisulfite	150 grains	10 grams

Negatives are allowed to remain in this bath for 4–6 minutes. A freshly prepared bath is to be used and discarded after one day's use. Where stock solutions must be kept on hand, the chrome alum and the bisulfite are made up into separate solutions of 20 grams each per liter of water (300 grains per quart). Equal portions of these solutions are mixed when needed.

Hypo Eliminator (Kodak HE-1)

	Avoirdupois	Metric
Water	16 ounces	500.0 c.c.
Hydrogen Peroxide, (3% sol'n.)	4 ounces	125.0 c.c.
Ammonia, (3% sol'n.)	3¼ ounces	100.0 c.c.
Water to make	32 ounces	1.0 liter

Wash the prints for about 30 minutes at 65° to 70°F. in running water which flows rapidly enough to replace the water in the vessel (tray or tank) completely once every 5 minutes. Then immerse each print about 6 minutes at 70°F. in hypo eliminator solution (HE-1) and finally wash about 10 minutes before drying. Further details on the use of this formula will be found by referring to the paper "Elimination of Hypo from Photographic Images" by Crabtree, Eaton, and Muehler, *Jour. Phot. Soc. Amer. 6, page 6, (1940)*.

Hypo Test

Process with the batch of prints an unexposed white sheet of photographic paper of the same weight and size as the majority of prints in the batch. After the final wash, cut off a strip of this sheet and immerse it in a 1 per cent solution of silver nitrate solution for about 3 minutes; then rinse in water and compare, while wet, in subdued daylight or artificial light with the wet, untreated portion. If the hypo has been completely removed no color difference should be observed. A yellow-brown stain indicates the presence of hypo.

* If it is desired to use crystalline sodium sulfate instead of the desiccated sulfate, then use 4 ozs. 290 grains per 32 ounces (140 grams per liter) when mixing the formula.

PHOTOGRAPHIC FORMULAS

TONERS FOR SLIDES AND FILMS

Uranium Toner (Kodak T-9) For Brown to Red Tones

	Avoirdupois	Metric
Uranium (Uranyl) Nitrate	35 grains	2.5 grams
Potassium Oxalate	35 grains	2.5 grams
Potassium Ferricyanide	15 grains	1.0 gram
Ammonium Alum	85 grains	6.0 grams
Hydrochloric Acid, 10% sol	1¼ drams	5.0 c.c.
Water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

The solution should be perfectly clear and pale yellow in color. *It is light sensitive, however, and should be stored in the dark.* The maximum effect is produced in about 10 minutes, the tone passing from brown to red during this time.

It is convenient to keep 10% stock solutions of the constituent chemicals of the above toning bath for quick compounding of a new bath.

For motion picture work, 120 gallons of the above bath will tone about 12,000 feet of film without any appreciable change in the tone. A volume of acid may then be added equal to that originally used, when a further 12,000 feet may be toned. After toning the second quantity of film, the bath should be discarded.

After toning, wash for about 10 minutes, though the washing should not be prolonged, especially if the water is slightly alkaline, since the toned image is soluble in alkali.

Sulfide Toner (Kodak T-10) For Sepia Tones

SOLUTION A	Avoirdupois	Metric
Potassium Ferricyanide	1 ounce	30.0 grams
Potassium Bromide	½ ounce	15.0 grams
Water to make	32 ounces	1.0 liter
SOLUTION B		
*Sodium Sulfide, fused (not sulfite)	13 grains	0.9 gram
Water to make	32 ounces	1.0 liter

The well washed slide is thoroughly bleached in A, washed for 5 minutes, and immersed in Solution B for about 2 minutes until thoroughly toned. The slide should then be washed thoroughly for 10 to 15 minutes before drying. The transparency of the tone is much improved by the addition of a little hypo to the B solution, say, 66 grains per 32 ounces or 4.5 grams per liter.

Iron Toner (Kodak T-11) For Blue Tones

	Avoirdupois	Metric
Ammonium Persulfate	7 grains	0.5 gram
Iron and Ammonium Sulfate (Ferric Alum)	20 grains	1.4 grams
Oxalic Acid	45 grains	3.0 grams
Potassium Ferricyanide	15 grains	1.0 gram
Ammonium Alum	75 grains	5.0 grams
Hydrochloric Acid 10%	¼ dram	1.0 c.c.
Water to make	32 ounces	1.0 liter

Dissolve chemicals in the order given.

The method of compounding this bath is very important. Each of the solid chemicals should be dissolved separately in a small volume of water, the solutions then mixed strictly in the order given, and the whole diluted to the required volume. If these instructions are followed, the bath will be pale yellow in color and perfectly clear.

Immerse the slides or films from 2 to 10 minutes at 70°F. (21°C.) until the desired tone is obtained. Wash for 10 to 15 minutes until the highlights are clear. A very

* Use three times the quantity of crystalline sodium sulfide.

slight permanent yellow coloration of the clear gelatin will usually occur, but should be too slight to be detectable on projection. If the highlights are stained blue, then either the slide (film) was fogged during development, or the toning bath was stale or not mixed correctly.

Since the toned image is soluble in alkali, washing should not be carried out for too long a period, especially if the water is slightly alkaline.

Dye Toners (Kodak T-20)

	Avoirdupois	Metric
*Dye	x grains	x grams
Acetone or Wood Alcohol	3¼ fluid ozs.	100.0 c.c.
Potassium Ferricyanide	15 grains	1.0 gram
Acetic Acid (glacial)	1¼ drams	5.0 c.c.
Water to make	32 ounces	1.0 liter

The nature of the tone varies with time of toning and eventually a point is reached beyond which it is unsafe to continue as the gradation of the toned image becomes affected. Average toning time at 65°F. (18°C.) is from 3 to 9 minutes. Further details on the use of this formula may be obtained by referring to the paper by Crabtree and Ives.†

ORGANIC COMPOUNDS USED AS PHOTOGRAPHIC DEVELOPERS

Acrol—See amidol.
Activol—See rhodinal.
Adurol—See chlorohydroquinone and bromohydroquinone.
Amidol (Acrol; Diamol; Nerol)—2, 4-Diaminophenol dihydrochloride, $C_6H_3(OH)(NH_2)_2 \cdot 2HCl$.
Athenon—See glycin.
Azol—See rhodinal.
Brom(o)hydroquinone (Adurol-Schering) — 2-Bromo-1, 4-dihydroxybenzene, $Br_6H_3(OH)_2$.
Catechol—See pyrocatechin.
Certinal—See rhodinal.
Chloranol—A combination of chlorohydroquinone and metol base, $ClC_6H_3(OH)_2 \cdot (CH_3NH)C_6H_4OH$.
Chlornol—See chlorohydroquinone. Not to be confused with chloranol (*q.v.*)
Chlor(o)hydroquinone (Adurol-Hauff; C.H.Q.; Chlornol; Quinotol)—2-Chloro-1, 4-dihydroxybenzene, $ClC_6H_3(OH)_2$.
C.H.Q.—See chlorohydroquinone.
Citol—See rhodinal.
Diamine-H—See para-phenylenediamine hydrochloride.
Diamine-P—See para-phenylenediamine.
Diaminophenol—See amidol.
Diamol—A trade name for either amidol (*q.v.*) or para-phenylenediamine base (*q.v.*) The term used in French literature usually refers to amidol. In the U.S.A. the term is a trade name of one company for its *p*-phenylenediamine.
Diogen—Sodium α-aminonaphthol-disulfonate, $NH_2C_{10}H_4(SO_3Na)_2OH$, (1:3:6:8)?
Diolene—See ortho-phenylenediamine.
Duratol—*p*-Benzylaminophenol, $C_6H_5CH_2 \cdot NHC_6H_4OH$.

* The quantity of dye varies according to the dye used as follows:

Safranine (Extra Bluish)	3 grains	0.2 gram
Chrysoidine 3R	3 grains	0.2 gram
Auramine	6 grains	0.4 gram
Victoria Green	6 grains	0.4 gram
Rhodamine B	6 grains	0.4 gram

All dyes listed can be supplied by the National Aniline and Chemical Co., 40 Rector St., New York, N. Y.

† "Dye Toning With Single Solutions" by J. I. Crabtree and C. E. Ives, *Trans. Soc. Mot. Pict. Eng. 12: 967 (1928).*

PHOTOGRAPHIC FORMULAS

Edinol—*m*-Hydroxymethyl-*p*-hydroxyaniline hydrochloride, $(CH_2OH)(OH)C_6H_3NH_2 \cdot HCl$.

Eikonogen—Sodium aminonaphtholsulfonate, $(NH_2)(HO)(SO_3Na)C_{10}H_5 \cdot 2\frac{1}{2}H_2O$ (1:2:6)

Elon—See metol.

Finegrainol—Undisclosed formula; probably a mixture or a double salt of two of the more common developing agents together with small amounts of some other substance.

Genol—See metol.

Glycin (Athenon; Monazol)—*N*-(*p*-Hydroxyphenyl)-glycine; (*p*-hydroxyphenylamino)-acetic acid, $HOC_6H_4 \cdot NHCH_2CO_2H$.

Gradol—Undisclosed formula; probably a derivative of *p*-aminophenol.

Hydramine—A combination of hydroquinone and *p*-phenylenediamine, $C_6H_4(OH)_2 \cdot C_6H_4(NH_2)_2$.

Imogen—AGFA compound not made public.

Hydroquinone—*p*-Dihydroxybenzene, $C_6H_4(OH)_2$.

Kachin—See pyrocatechin.

Kodelon—See par(a)aminophenol.

Meritol—A combination of pyrocatechin and *p*-phenylenediamine, $C_6H_4(OH)_2 \cdot C_6H_4(NH_2)_2$.

Metol (Elon; Genol; Monotol; Photol; Pictol; Rhodol; Satrapol; Veritol)—*p*-Methylaminophenol sulfate, $HOC_6H_4(NHCH_3) \cdot \frac{1}{2}H_2SO_4$.

Metoquinone—A combination of hydroquinone and metol base, $C_6H_4(OH)_2 \cdot 2C_6H_4(OH)(NHCH_3)$.

Monazol—See glycin.

Monomet—*p*-Amino-*o*-cresol hydrochloride, $C_6H_3(CH_3)(OH)(NH_2) \cdot HCl$ (1:2:5).

Monotol—See metol.

Neol—Aminosalicylic acid, $C_6H_3(NH_2)(OH)(CO_2H)$(5:2:1).

Nerol—See amidol.

Orthamine—See ortho-phenylenediamine.

Ortho-phenylenediamine (Diolene; Orthamine) — 1, 2-Diaminobenzene, $C_6H_4(NH_2)_2$.

Ortol—A mixture of hydroquinone and *o*-methylaminophenol sulfate, $C_6H_4(OH)_2 + C_6H_4(OH)(NHCH_3) \cdot \frac{1}{2}H_2SO_4$.

Paraminol—A condensation product of hydroquinone and *p*-aminophenol.

Par(a)aminophenol (Kodelon)—*p*-Aminophenol, usually sold as the oxalate or the hydrochloride salt. Free base: $C_6H_4(OH)(NH_2)$; Kodelon: $C_6H_4(OH)(NH_2) \cdot HCl$.

Paranol—See rhodinal.

Para-phenylenediamine (Diamine-P; Diamol) — 1, 4-Diaminobenzene, $C_6H_4(NH_2)_2$.

Para-phenylenediamine Hydrochloride (Diamine-H; P.D.H.)—1, 4-Diaminobenzene dihydrochloride, $C_6H_4(NH_2)_2 \cdot 2HCl$.

P.D.H.—See para-phenylenediamine hydrochloride.

Phenylenediamine—See para-phenylenediamine and ortho-phenylenediamine.

Photol—See metol.

Pictol—See metol.

Pyrocatechin (Catechol; Kachin)—*o*-Dihydroxybenzene, $C_6H_4(OH)_2$.

Pyro—See pyrogallol.

Pyrogallic Acid—See pyrogallol.

Pyrogallol (Pyro; Pyrogallic Acid)—1, 2, 3-Trihydroxybenzene, $C_6H_3(OH)_3$.

Quinotol—See chlorohydroquinone.

Reducin—1, 3, 5-Triamino-2-hydroxybenzene trihydrochloride, $C_6H_2(OH)(NH_2)_3 \cdot 3HCl$.

Rhodinal (Activol; Azol; Certinal; Citol; Paranol)—Sodium *p*-aminophenolate, $C_6H_4(NH_2)(ONa)$. Usually sold in the form of a solution.

Rhodol—See metol.

Rubinol—Undisclosed formula; probably a derivative of pyrogallol.

Satrapol—See metol.

Veritol—See metol.

6.94	20	22	28	1000	4400	15/10
8.85	24	23	29	1270	5600	16/10
11.3	32	24	30	1600	7200	17/10
14.4	40	25		2020		18/10
18.4	50	26		2540		19/10
23.3	64	27		3200		20/10

The table must be used with caution because the various speed ratings, being based upon entirely different principles, cannot be compared directly with each other. It must be borne in mind that an effective speed of a given emulsion depends upon the type and character of developer used in processing.

PHOTOGRAPHIC FILM EMULSIONS

The following table gives an *approximate* comparison of the properties of various photographic emulsions. It should not be considered as a comparison of products from different manufacturers. The values given in the column headed *Mfrs. Approximate Percentage* are comparable only within a group of emulsions from the same manufacturer and are intended to show the relative speeds based upon a particular emulsion to which has been given the arbitrary rating of 100%. Thus, an emulsion rated at 200 is twice as fast as the emulsion prepared by the same manufacturer which is rated at 100 and requires only ½ the exposure; similarly, a 50 rating indicates ½ the speed of the 100 base and would require twice the exposure time.

The speed ratings given in the column headed *Weston* and *Scheiner* are also subject to a number of variables such as spectral quality of the light used in the exposure, the type of developer, the method and degree of development, age of the emulsion, etc. Inasmuch as Weston and Scheiner speeds are not exactly comparable a number of inconsistencies are bound to appear in these speed rating columns. The user of this table is therefore advised to use the same as a guide to selecting various films and to depend upon the values supplied by the manufacturer of the exposure meter being used and the development advised by the manufacturer of the film.

The filter factors are those for the well known Wratten filters. It should be noted that properties given in the column headed *Characteristics and Special Properties* will vary widely with different processes and procedures of development.

The manufacturers are indicated by the abbreviations as follows: A, Agfa; D, Defender; Du, Du Pont; Dy, Dufay; E, Eastman; G, Gevaert; P, Perutz.

LABORATORY ARTS AND RECIPES

PLATINUM (Courtesy J. Bishop and Co. Platinum Works, Malvern, Pa.)

1. Purposes for which Platinum can be used

A—Fusions

1. Fusions with sodium carbonate or fusion mixture.
2. Fusions with sodium carbonate and sodium nitrate or nitrite.
3. Fusions with sodium borate or sodium metaphosphate.
4. Fusions with alkali bifluorides.
5. Fusions with alkali or alkaline earth chlorides.
6. Fusions with alkali bisulfates.

Loss of weight of the platinum amounts to only a fraction of a milligram in case 1 and is practically nil in case 4. Nitrates or nitrites in the fusion mixture (case 2) cause heavier losses of platinum, but under the usual laboratory conditions these are not likely to exceed 1-2 mg. Borax is inert to platinum and sodium metaphosphate attacks the metal only at very high temperatures or under reducing conditions. Alkali chlorides and alkaline earth chlorides attack the metal above 1000° C. in the presence of air which liberates chlorine from the fused salt; in a neutral atmosphere they are inert. Alkali bisulfates attack platinum slightly above 700° C.; the attack is diminished by addition of ammonium sulfate.

In all cases except case 4, traces of platinum should be looked for in the solutions when making accurate analyses; the platinum is precipitated with the hydrogen sulfide group.

B—Evaporations

1. Evaporations with sulfuric acid with or without hydrofluoric acid.
2. Evaporations with hydrofluoric acid.
3. Evaporations with hydrofluoric and nitric acids in the absence of halides, especially chlorides.
4. Evaporations with hydrochloric acid in the absence of oxidizing agents which yield nascent chlorine.
5. Evaporations with alkali hydroxides or carbonates to avoid contamination of the solution with silica, etc.
6. Evaporations with sodium peroxide solutions (cf. II. C. 6).

C—Ignitions

1. Ignition of barium sulfate.
2. Ignition of alkaline earth carbonates, oxalates, etc.
3. Ignition of sulfates of metals which are not readily reducible.
4. Ignition of oxides which are not readily reducible, e. g., Al_2O_3, MgO, BaO, CaO, SrO, TiO_2, ZrO_2, ThO_2, MoO_3, WO_3, Ta_2O_5, Cr_2O_3, Mn_3O_4, and in the absence of carbonaceous matter ZnO, Co_3O_4, NiO, CdO.
5. Determination of ash in organic materials, e. g., coke, coal, plants.

The carbonaceous matter should be burnt off at as low a temperature as possible with free access of air to avoid danger of contamination of the platinum with sulfur, phosphorus, iron, etc., derived from reduction of sulfates, phosphates, iron compounds, etc., present in the material.

6. Determination of volatile matter in fuels. Here the maintenance of a non-oxidizing atmosphere is essential to prevent loss of fixed carbon hence there is a greater danger of contamination of the platinum, especially when the fuel is rich in sulfur or phosphorus compounds.

D—Electrolytic Operations

1. As an anode in most electrolytes except strongly acid chloride solution.
2. As cathode for the deposition of metals from acid, alkaline or ammoniacal solutions. For the deposition of zinc, gallium and bismuth, the platinum should first be copper-plated to prevent superficial alloying with the deposited metal.

Atmospheres in Which Platinum Can Be Heated:

1. Air, nitrogen and oxygen up to the melting point of platinum.
2. Oxides of nitrogen.
3. Bromine and iodine vapor.
4. Hydrogen, carbon dioxide.

2. *Conditions Under which Platinum is Attacked*

A—By Heating in Atmospheres Containing the Following Gases:

1. Ammonia: the surface becomes darker, less lustrous and soon develops pores and a crystalline appearance.
2. Sulfur dioxide: sulfur trioxide is formed and the platinum surface becomes coated with platinous sulfide.
3. Chlorine: the metal becomes converted into a mass of crystals due to the alternate formation and decomposition of platinous chloride.
4. Volatile chlorides especially those which readily decompose.
5. Highly carburetted gases and vapors; the metal disintegrates, possibly with the formation of PtC_2, and becomes very brittle. Hence platinum ware should never be heated in the reducing zone of a gas flame.

B—By Heating in the Following Liquids:

1. Aqua Regia.
2. Hydrochloric acid and oxidizing agents.
3. Concentrated sulfuric acid. The action is extremely slow and, for all laboratory purposes, negligible.
4. Concentrated phosphoric acid. Here again the action is noticeable only after very prolonged heating.

C—By Heating in the Following Solids, Their Fusions or Vapors:

1. Sulfur, selenium and tellurium. The action of sulfur vapor is very slow, and prolonged heating is required to produce any serious effect; selenium and tellurium readily combine with platinum.
2. Phosphorus, arsenic and antimony. Combination with platinum occurs readily at a red heat.
3. Magnesium pyrophosphate above 900° C.
4. Silica and borax at high temperatures.
5. Molten lead, zinc, tin, bismuth, silver, gold, or copper or mixtures which form these metals by reduction.
6. Fused alkali oxides and peroxides, and, to a smaller extent in the presence of air, alkali hydroxides.
7. Fused nitrates. The action is intensified by the presence of alkali hydroxides or carbonates but in no case is it very severe (see I. A. 2 *et seq.*).
8. Phosphorus pentoxide or phosphoric acid. The action is relatively small.
9. Fused cyanides. Platinocyanides are formed.
10. Iron oxide above 1200° C. Oxygen is liberated and the iron combines with the platinum.
11. Silica, silicates, alumina and magnesia above 1600° C. At lower temperatures no action occurs.
12. Fused alkali and alkali chlorides in the presence of air at 1000° C. or above (see I. A. 5).
13. Lead and bismuth oxides above 1250° C.

CLEANING PLATINUM

(Reprinted by permission of the Baker Platinum Works, Newark, N. J.

Every careful analyst of necessity uses clean utensils. The habit of cleaning and polishing platinum ware immediately after using is easily formed, and repays the user with increased confidence in his work as well as with the prolonged life of the article.

The loosening effect of the Bunsen flame upon the surface of platinum exposed to its action produces the familiar gray appearance which cannot be removed except by burnishing. Rubbing the surface of platinum with moist sea sand (round grains only), applied with the finger, serves to remove most impurities and to polish the metal, without material loss in weight.

Fusing bisulphate of potash or borax in the vessel and then boiling in water and polishing as above with sand is recommended by Gmelin. When it is desired to clean the outer surface of vessels in this manner, they must be placed in dishes of sufficient size to allow the fused flux to envelope completely the article to be cleaned.

LABORATORY ARTS AND RECIPES

Sodium amalgam possesses the property of wetting platinum without amalgamating with it, even when other metals are purposely added to the amalgam. This substance is, therefore, useful for effecting a quick and thorough cleansing of platinum. The amalgam is gently rubbed upon the metal with a cloth and then moistened with water, which oxidizes the sodium and leaves the mercury free to alloy with foreign metals. The mercury is then wiped off and the article cleaned and polished with sand, as above described.

If the existence of a base metal alloyed with the platinum is suspected, immerse the article in question first in boiling HCl for a few minutes; then, after thoroughly rinsing with clean water, in boiling HNO_3 free from chlorine. If the article is unaffected in weight or appearance, and the acid baths fail to give reaction for base metals, the absence of such is assured.

PERMANENT MARKING OF GLASS AND PORCELAIN VESSELS.

(Reprinted from *The Chemist-Analyst*, J. T. Baker Chemical Co., Phillipsburg, N. J., publishers, by permission.)

According to H. G. Isbell (*Vol.* 20, *No.* 3, *p.* 20, 1931) a good ceramic ink can be made from the following: 1 part K_2CO_3, 1 part $Na_2B_4O_7$, 2 parts PbO, 2 parts $Co(NO_3)_2$ or other salt of cobalt. Grind this mixture in a mortar to a fine powder (dry if necessary). Mix intimately with a mixture of 4 parts copaiba balsam, 1 part clove oil, and 1 part lavender oil; if these oils are not available raw linseed oil may be used in place of the oil mixture. The amount of oil used should be such that the mixture will run slowly from a pen. The desired markings are made on a clean surface which is then warmed gently over a flame to dry the oil and prevent cracking in the final heating. The place where the marking has been made is then heated slowly by holding against the side of a flame at a tangent and the article rotated slightly. The marking first turns black due to the carbonization of the oil after which it will begin to glow red. At this point the article is removed from the flame and allowed to cool slightly after which it is reheated until the markings, not the glass, begin to glow. The marking thus obtained presents a smooth and shiny surface, blue in color, which cannot be removed by mechanical or the usual chemical means.

Robbins (*The Chemist-Analyst, Vol.* 18, *No.* 1, *p.* 18, 1929) gives the following directions for the marking of glassware by lead etching.—(1) Take a quantity of PbO or Pb_3O_4, break up all lumps to a fine powder, place in a dish, and warm slightly over a flame to remove traces of moisture. (2) The glass to be etched must be free from finger prints, moisture, or grease. (3) An ordinary rubber stamp having the desired lettering and an ordinary stamp pad are used. Stamp the wording on the part to be etched, shake a small quantity of the lead oxide over the wording, and brush off the excess lead oxide with a camel's hair brush. The ink from the stamp pad acts only as a binder for the oxide. (4) Run the piece of glassware through the flame until the oxide has a glassy appearance. In some cases the wording may become black due to the formation of a higher oxide of lead by the use of the oxidizing part of the flame. This higher oxide may be removed by holding in the extreme upper part of the flame, and burning the oxide off, leaving a clear etching. (5) Care must be taken to avoid too hot a flame as this has a tendency to spread the lead.

Matthews (*The Chemist-Analyst, Vol.* 18, *No.* 1, *p.* 22, 1929) prepares a marking ink for chemical porcelain as follows: —18.8 grams of commercial, black cobalt oxide, 1.2 grams of bismuth subnitrate, 15 cc of turpentine, 15 drops of Dresden thick oil. This mixture is ground together and applied to the porcelain with a pen. The porcelain is then heated slowly to evaporate the liquids and finally ignited.

Gifford (*The Chemist-Analyst, Vol.* 18, *No.* 1, *p.* 16, 1929) recommends that apparatus, flasks, test tubes, beakers, etc., which are used daily in making routine analyses be marked with a good grade of automobile enamel of any desired color. The marking is placed on the etched circle with either a marking brush or a tooth pick. When it is desired to remove the marking it is first scraped with a knife and finally washed with carbon tetrachloride or other suitable solvent.

LABORATORY ARTS AND RECIPES

Hirsch (*The Chemist-Analyst, Vol.* 19, *No.* 1, *p.* 18, 1930) finds that permanent identification marks, superior to those often written with blue wax pencils, may be made on laboratory ware, such as crucibles, evaporating dishes, etc., with ordinary blue black ink, using a pen as a marker. The surface to be marked is wiped dry and the desired characters made conveniently with a fountain pen, using sufficient ink to give a continuous opaque film. After allowing the ink to dry, the surface is gradually ignited over a Meeker burner, finally bringing the flame to bear directly upon the configurations until fused into the surface or glaze. A successful marking is reddish brown, smooth, homogeneous, and without any appearance of external roughness. This method was applied to marking tare weights on pyrex beakers used as drying dishes, thereby obviating continual reweighing. During the ignition to fuse in the numerals, the beakers lost about ½ milligram in weight; allowance, therefore, was made in marking. The marked weights themselves serve as identifications. A similar procedure is employed by Liebschultz (*ibid. No.* 9, *p.* 11, 1914) and by Baker (*ibid. No.* 7) for the marking of crucibles except that they recommend the addition of a trace of platinum chloride to the ink used in marking.

Schollenberger (*The Chemist-Analyst, Vol.* 18, *No.* 1, *p.* 17, 1929) recommends that porcelain and silica ware be marked with platinum. According to his procedure, about one decigram of scrap platinum is dissolved in aqua regia in a small porcelain crucible and the solution evaporated to dryness. About 1 cc of lavender oil is added and the mixture stirred until permanently mixed. The ware to be marked is warmed slightly and the mixture applied with a rubber stamp or thinly painted on with a fine brush, sharpened match, or something of the kind. The ware is then gently heated to burn off the oil and strongly ignited to fuse the metal into the surface, producing a distinct black mark. If applied too thickly the characters may be blurred, or may be a metallic mirror less distinct than the black deposit. If the marking ink becomes gummy after long keeping, it may be thinned with a little more of the oil.

Temporary marks may be made on glass or porcelain by writing with a graphite pencil on a ground or sandblasted portion. Glassware is often furnished with a small sandblasted label for such markings, but often the sandblasting is so poorly done that a legible result is difficult to produce. By the use of a discarded piece of alundum ware, a good ground surface is easily made on glass or porcelain; the edge of the alundum is wetted with water and rubbed with short firm strokes at the place desired. Surfaces so ground take pencil more readily than a sandblasted label and the mark is more readily erased with a rubber eraser when desired. Even porcelain crucibles thus marked may be ignited and the mark survive several ignitions but ink is better for this purpose. Ground surfaces thus produced have not been found to increase liability to breakage on heating.

CLEANING MIXTURES FOR CHEMICAL GLASSWARE AND PORCELAIN

The commonly employed chromic acid cleaning mixture which may be used repeatedly until the crystals have disappeared and the solution assumes a greenish tinge, is prepared by mixing with the usual precautions 800 cc of crude, concentrated sulfuric acid with 500 cc of a saturated solution of potassium dichromate in water.

Potassium dichromate, the active material in the ordinary dichromate-sulfuric acid cleaning mixture, leaves the by-products potassium sulfate and chromic sulfate which gradually accumulate leaving the mixture worthless. If heat has been applied to hasten the action or to evaporate any water which has been absorbed, the chromic sulfate sometimes adheres so firmly to the apparatus which is being cleaned that it can only be removed with difficulty. Various solutions have been devised to replace it. Trisodium phosphate as a possible laboratory detergent has been investigated and has much to recommend it. A 15% solution, heated to about 70°C. may be used for cleaning burettes and other volumetric glassware with satisfactory results.

Mathers (*The Chemist-Analyst, No.*

LABORATORY ARTS AND RECIPES

13, *p.* 10, 1915) recommends placing the glass or porcelain apparatus in a large evaporating dish containing hot sulfuric acid and a little nitric acid. If the apparatus is not completely immersed in the hot acids, it is turned after a few minutes so that the cleaning solution comes in contact with every part. The acids should be kept very warm but not hot enough to evolve sulfur trioxide or to distil out the nitric acid. The solution is permanent except that sufficient nitric acid must be added from time to time to keep it white or at least yellow in color rather than black. This mixture has been found especially useful in cleaning dyes, gums and waxes from glassware. A thin film like a dye will be removed almost instantly, but the removal of masses of organic material requires longer treatment.

Gibbs (*The Chemist-Analyst, Vol.* 20, *No.* 4, *p.* 17, 1931) describes a material which effectively cleans glassware in a minimum of time and which works effectively in cold water. It is prepared as follows. Take a 10 oz. cake of a good grade of cleaning and polishing grit cake soap, such as "Bon Ami" and pulverize it to a powder with a mortar and pestle. Cut a 12 oz. cake of a good grade of rosin laundry soap, such as "Octagon," into thin slices and add just enough water to cover the mass. Slowly heat on a hot plate until the soap has dissolved in the water and a clear solution results. Add this liquid soap mixture to the powdered grit cake in a beaker or earthen jar, stirring the mixture well. Allow to stand over night or until the resulting mixture has solidified into a soft mass. This mixture can then be applied to the wet glassware in the usual manner with a brush or the hands, scrubbing thoroughly and finally rinsing in running water. It is only necessary to add small quantities of water from time to time to keep the mixture at the proper consistency.

REMOVAL OF MARKINGS FROM LABORATORY PORCELAIN

It is often desirable to change the old markings on porcelain beakers or evaporating dishes. Cox (*The Chemist-Analyst, Vol.* 19, *No.* 4, *p.* 22, 1930) describes a method for removing such markings leaving a clean, easily remarked surface. It consists merely of washing the old marks with hydrofluoric acid solution and washing the excess acid off as soon as the mark is removed. The hydrofluoric acid is easily applied with a rubber policeman on the end of a glass stirring rod. The acid attacks the markings before it does the porcelain, but if the acid is left on longer than necessary to remove the marks, the porcelain may become etched. The same process may be used to make a surface on new porcelain so that it will take ink easily and not allow the ink to run in burning.

INK REMOVERS

Mathews (*The Chemist-Analyst, Vol.* 18, *No.* 1, *p.* 22, 1929) suggests the following procedure for the removal of ink from paper or cloth. An alkali hypochlorite is first applied to the ink to be removed, followed by an application of dilute acid. To remove red ink stains, cover the spot with concentrated potassium permanganate solution for five minutes. Then place the material in an oxalic acid solution until the permanganate spot disappears. A rather concentrated solution of sodium bicarbonate may be used to neutralize the oxalic acid. Wash the material thoroughly with water. Repeat the process if the stain is not completely removed. Black ink stains may be removed in a similar manner. Always wash well with fresh water after using these solutions.

PURIFICATION OF MERCURY

The purest mercury is obtained by special methods of distillation, a description of which is beyond the scope of this book. The reader is referred to the description of a method by Booth and Jones (*Jour. Ind. Eng. Chem.*, 19, 104, 1927). But for many laboratory uses one of the following methods will yield a material of sufficient purity. If the mercury is very dirty an initial purification can be made by filtering through a dry filter paper having several pin-holes

at the apex; or it may be squeezed through the pores in a piece of clean chamois skin.

(*a*) Mercury is shaken in a separatory funnel with a paste of concentrated sulfuric acid and mercurous nitrate, after which it is separated, washed with water, separated from the water, poured into a porcelain evaporating dish, the last visible traces of water removed with a clean blotter or piece of filter paper, and then dried in an oven at 100-10°C.

(*b*) Mercury is placed in a glass or porcelain beaker, then covered with a layer of nitric acid (10 cc concentrated acid diluted with 90 cc of water) and air bubbled through the mercury layer for about 24 hours, after which it is separated, washed, and dried as described in part *a*.

(*c*) Mercury is allowed to spray from a funnel, with a capillary point, into an aqueous 10% sodium hydroxide solution contained in a glass tube one inch in diameter and about three feet in length, which is held in a vertical position and which has fused to its lower end a smaller diameter tube bent so as to form a U-tube and of a length somewhat more than 1/13.6 the length of the aqueous column in the large tube. A small amount of mercury is poured into the U-tube and this supports the column of aqueous solution above it in the large diameter tube. The open end of the small tube is bent over at the top (but for only a very short distance to prevent its acting as a syphon) to form a convenient delivery for the mercury. As the mercury enters the large diameter tube it falls to the bottom of the U-tube and over-flows through the small tube. After several successive passages through the column of sodium hydroxide solution, the mercury is passed in the same manner through dilute nitric acid (10 cc concentrated nitric acid and 90 cc of water), and finally several times through distilled water, after which it is dried as described in method *a*.

DESICCATOR LID LUBRICANT

Case (*The Chemist-Analyst, Vol.* 21, *No.* 2, *p.* 23, 1932) recommends the following preparation as an economical and efficient lubricant for desiccator lids. Two grams of dry soap powder are added to 100 cc of medium grade lubricating oil. The mixture is heated to 150-200°C. (300-400°F.) with stirring for a few minutes until the solution is complete. Twenty grams of paraffin wax are then added with stirring, thus forming a stiff jelly which is not subject to the usual room temperatures. The addition of the paraffin produces a smoother grease which permits a desiccator lid to slide easily even under considerable vacuum.

STOPCOCK LUBRICANT

Meloche and Frederick (*Jour. Amer. Chem. Soc.* 54, 3264, 1932) describe the preparation of a stopcock grease which is not affected by many organic solvents and in which most other greases are soluble. It is prepared as follows. A thick paste is prepared by mixing 25 grams of anhydrous glycerol, 7 grams of dextrin, and 3.5 grams C. P. *d*-mannitol, then heating until the mixture just begins to boil and cooling to room temperature with stirring. The viscosity of the mixture can be increased by the addition of more dextrin and the fluidity can be increased by the addition of more glycerol. The grease is suitable for use with the following solvents: acetic anhydride, acetophenone, benzaldehyde, benzene, bromobenzene, carbon disulfide, carbon tetrachloride, chlorobenzene, tetrachloroethane, cyclohexane, ethyl acetate, ethyl acetoacetate, ethyl bromide, ethyl carbonate, ethylene bromide, ethylene chloride, methyl acetate, methylaniline, nitrobenzene, nitromethane, petroleum ether, diphenyl ether, toluene, *o*-toluidine, turpentine, and *o*-xylene. It is not suitable for use with aniline, acetic acid, *tert*-amyl alcohol, benzyl alcohol, *n*-butyl alcohol, *tert*-butyl alcohol, ethyl alcohol, methyl alcohol, diethylamine, ethylene chlorohydrin, ethylene glycol, formic acid, propionic acid, pyridine, quinoline, water, and solvents containing water.

Shepherd and Ledig (*Jour. Ind. and Eng. Chem.* 9, 1059, 1927) have developed several different stopcock greases of the following compositions. (*a*) For high vacuum work requiring a viscous lubricant, 31 parts pale crepe rubber, 24 parts white vaseline, 5 parts paraffin (melting point 36°C.). (*b*) For general laboratory

LABORATORY ARTS AND RECIPES

uses, 6 parts pale crepe rubber, 7 parts vaseline, 1 part paraffin. (*c*) A light grease for volumetric burette cocks where easy manipulation is desired, 10 parts smoked sheet or pale crepe rubber, 18 parts white or yellow vaseline, 1 part paraffin (melting point 30°C.) The mixture of the respective ingredients is heated to 155°C. for 190 hours with continuous stirring, then poured into 2-ounce ointment cans, a small portion to each can and chilled on ice immediately. After aging for 10 days the grease is ready for use.

LABORATORY CEMENTS

Litharge-glycerol cement is prepared by adding sufficient litharge to a mixture of six parts commercial 95% glycerol (glycerine) with one to three parts of water to form a paste of the desired consistency. Inert materials such as iron oxide, sand, or Fuller's earth are often added to retard the setting time and to prevent cracking. This cement is fairly acid resistant.

Jackson (*The Chemist-Analyst, Vol.* 20, *No.* 2, *p.* 23, 1931) prepares a general laboratory cement from the following materials: 1 part or 25 grams of asphalt, 6 parts or 150 grams of rosin, 3 parts or 75 grams of rubber, and 1 part or 25 cc of turpentine. Mix the rosin and asphalt, heat with a small flame and then add the rubber (an old inner tube is satisfactory). The mixture is heated at as low a temperature as possible to keep it fluid and until nearly all the rubber is melted, which requires about two or three hours. The turpentine is then added and the heating continued two or three hours or until the mass becomes homogeneous. It is best to heat in a large beaker as there is a tendency to frothing and it should be stirred at intervals of fifteen minutes. The cement may then be cast into sticks for convenient use. The cement is applied (to dry surfaces only) by holding in a small flame until it liquifies or catches fire; it is then applied directly. This cement is satisfactory for an adhesive to make gas tight joints as well as other uses where it is desired to stick two objects together. It is not affected by chemical reagents in moderate concentrations. The formula above gives a pliant cement that is somewhat sticky when cold; it does not adhere to the fingers when touched. A harder and less pliant cement may be made by increasing the amount of rosin.

Matthews (*The Chemist-Analyst, Vol.* 18, *No.* 1, *p.* 22, 1929) suggests a cement for porcelain, metals or stoneware. Casein is soaked in an equal weight of water for two hours during which time the casein swells but does not dissolve. At the end of this time, sodium silicate and lime are stirred in and the cement is ready for use.

LACQUER

Taylor (*The Chemist-Analyst, Vol.* 20, *No.* 4, *p.* 10, 1931) finds that an excellent label lacquer and general utility cement may be prepared from the pyroxylin handles of discarded tooth brushes. The bristled end is broken off and the handle dissolved in enough of a solvent such as butyl acetate, acetone, or ether-alcohol to give a glycerine-like consistency. About 300 cc of solution usually results. The color of the original handle is unimportant since even the darkest ones give an almost colorless film. The lacquer so prepared is not only useful for protecting labels but has been used successfully for sealing leaks in apparatus, notably vacuum distillation, and sealing bottles against moisture. It is a good library paste since it does not wrinkle paper, and it may also be used to cement pieces of glass together.

TEMPERATURE SENSITIVE PAINTS

Paper impregnated with temperature sensitive paint will change color when heated by a flame, electric spark, etc. Such paper is suitable for use in recording systems, for application to bearings, on condensers to indicate if sufficient water is being used for cooling, and other readily suggested uses. Any one of the following four mixtures is suitable for this purpose. (1) One part by weight of cuprous iodide and 1 part of mercuric chloride are ground to a fine powder and mixed with a thin, light colored, non-acid oil or spirit varnish. It is applied to a surface with a brush (do not apply to aluminum). The color is bright red be-

low 130°F. at which temperature it begins to darken, becoming noticeably darker at 135°F. and at 145°F. the color is maroon; at 155°F the color changes to a light chocolate, to a dark chocolate at 160°F, and at 212°F it is black. Decomposition begins at 300°F.

(2) Aniline hydrochloride 9.8 grams, potassium nitrate 8.0 grams, and water 100 cc.

(3) Nickel nitrate 5.0 grams, sodium thiosulfate 3.9 grams, sodium nitrate 1.0 grams, 1% gelatin solution 5 cc, and water 100 cc.

(4) Gelatin 10 grams, sodium chloride 5 grams, phenolphthalein 0.5 grams, and water 100 cc.

BLACK ACID PROOF STAIN FOR WOOD

Kiskadden (*The Chemist-Analyst, Vol. 20, No. 3, p. 17, 1931*) gives the following formula for an acid proof stain for wood. Solution No. 1: Iron sulfate 4 parts, copper sulfate 4 parts, potassium permanganate 9 parts, and water 83 parts. Solution No. 2: Aniline 12 parts, hydrochloric acid 18 parts, and water 70 parts. Apply two coats of No. 1; the second coat being applied as soon as the first has dried. Rub off the excess of the last coat when dry and apply two coats of No. 2. Dry thoroughly and apply a coat of linseed oil using a cloth. The color develops into an ebony black in a few hours. The surface may be washed with soap and water. One hundred cc of No. 1 will cover approximately 20 sq. ft. of surface; 50 cc of No. 2 will cover approximately 20 sq. ft. of surface.

According to the U. S. Bureau of Chemistry the same results are obtained by an application of the following two solutions. No. 1: Copper sulfate 125 grams and potassium chlorate 125 grams are dissolved in 1000 cc of water. No. 2: Aniline hydrochloride 60 grams and hydrochloric acid (sp. gr. 1.20) 90 cc are dissolved in 500 cc of water. Application: Paint the wood first with solution No. 1 and as soon as it dries sufficiently, apply a coat of solution No. 2; allow to dry for several hours. Wash with hot water and repeat the operations until the color is a dark green. Finish by rubbing with raw linseed oil until a jet black surface is obtained.

DRESSING WAX FOR ALBERENE DESK TOPS

Melt 450 grams of paraffin on a water bath, cool to 60°C., add 340 cc of kerosine with constant stirring, and then add 340 cc of gasoline.

HEAT FILTERS

Either of the following two solutions may be employed to prevent heat rays from passing, and permit light rays to pass through. They are used in glass cells being placed between the source of artificial light and other parts of the optical apparatus. Solution No. 1: copper sulfate 0.5 grams, water 100 cc, and sulfuric acid 1 drop. Solution No. 2: ferrous ammonium sulfate 20 grams, water 100 cc, and sulfuric acid sufficient to clear the solution or about 5 drops. These solutions are stable for about two weeks.

ELECTRICAL POLARITY INDICATORS

Dipping the ends of the two wires into a dilute solution of sulfuric acid or of salt will produce about the negative terminal a larger number of bubbles of gas than appear at the positive terminal.

Another method is to cut strips of filter paper and then immerse them in a solution of sodium chloride containing a few drops of phenolphthalein indicator; the strips thus prepared are then dried. When ready for use, they are moistened with water and the terminal wires are touched to the paper strips. A pink coloration appears at the point of contact with the negative terminal.

PRESERVATIVE FOR ALGAE, etc.

King's fluid for the preservation of algae consists of the following mixture: 50 grams of distilled water, 0.5 grams of glacial acetic acid, 0.2 grams of copper nitrate crystals, 0.2 grams of copper chloride crystals, and 50 grams of camphor water prepared by allowing a lump of camphor to stand in distilled water for a few days.

FORMULAS AND PROPERTIES OF DENATURED ALCOHOLS

The information given in the tables on denatured alcohols has been compiled from information furnished by Dr. Carl Haner of the Publicker Commercial Alcohol Company, Philadelphia, Pa., and from the publication *ALCOHOLS AND SOLVENTS*, copyright 1936 by the Publicker Commercial Alcohol Co.; reprinted by permission of the publishers. Cf. also Appendix to Regulations, No. 3 (1939); 5¢, Supt. of Documents, Washington, D. C.

Because of its use in beverages, nearly every country has considered alcohol a proper article for taxation and government control. The tax on alcohol is usually high so that the cost of pure alcohol is far above the cost of actual manufacture. In the United States of America, alcohol which has not been denatured is subject to the Internal Revenue Tax except to Colleges, Charitable Institutions, Scientific Research Laboratories, Hospitals and Sanitariums, which institutions may obtain Tax-free Permits upon application to the Department of Internal Revenue. Alcohol which is intended for industrial purposes is not subject to this high tax, but to make possible the removal from taxation it is necessary to render the alcohol unfit for beverage purposes. Such non-beverage alcohol is termed *denatured alcohol.*

Under the regulations of the Department of Internal Revenue, ethyl alcohol may be denatured with a wide variety of materials which render the alcohol unfit for beverage purposes. Each formula of *specially denaiured alcohol* has its approved uses and in many cases the formula has been devised particularly for one exacting type of industry. Sales of specially denatured alcohol are permitted only to those who have qualified under Internal Revenue Regulations and who hold the permit indicating authorization for use in specified processes. Certain types of denatured alcohol, which have been rendered unfit for beverage purposes by the addition of denaturants prescribed by the Department of Internal Revenue, may be purchased for manufacturing requirements, for anti-freeze purposes, or for any other legitimate use by the general public without the necessity of obtaining any form of permit. Dealers selling *completely denatured alcohol* must keep accurate records of receipts and sales including serial numbers, which must be available to authorized government officers at any time.

In the tables which follow, the formulas, their numbers, and authorized uses, are set by the United States Government. They are the only ones that can be used by manufacturers in the United States. These are changed from time to time but at no set interval. The Government can make changes at will either for the benefit of the manufacturers of new products or for the protection of the revenue. In the past, changes have not been numerous but an attempt is being made at the present time to reduce the number of available formulas. If this proves feasible, some major changes may be expected in the near future.

The values in the table, giving specific gravity and weight per gallon of the specially denatured alcohols prepared from 190° proof alcohol, are those determined by the U. S. Bur. of Standards. The specific gravity is "true specific gravity," *i.e.*, all weighings are corrected for the buoyancy of the air. It was necessary, therefore, to change these values to "apparent specific gravity" before they could be multiplied by the weight of a gallon of water (8.32823 pounds in air at 15.6°C.) to give the weight of a gallon of alcohol at the same temperature. The magnitude of this correction to specific gravity is as follows:

True specific gravity at 15.6°/15.6°C.	Correction	Apparent Specific gravity at 15.6°/15.6°C.
0.70	−0.00035	0.69965
0.80	−0.00023	0.79977
0.90	−0.00012	0.89988

The type of shipping container suitable for transportation of the various denatured alcohols is indicated by the abbreviations **T, D, B,** and **G** which mean tank car, drum, barrel, and glass, respectively.

FORMULAS FOR SPECIALLY DENATURED ALCOHOL

Formula Number	Composition: Giving amounts of denaturants to be added to 100 gallons of 190° proof ethyl alcohol	Properties of Finished Formula: Weight in lbs./gal. at 15.6°C.	Sp. gr. in vac. 15.6°/15.6°C.	% Ethyl alcohol: by vol.	% Ethyl alcohol: by wt.
1	5 gal. approved wood alcohol (*b*) T, D, or B	6.785	0.8149	90.47	86.30
1A	10 gal. of denaturing grade isopropanol and 0.5 gal. of commercial α-terpineol T, D, or B	6.809	0.8175	85.98	80.64
2A	2 gal. approved wood alcohol and 2 gal. benzene T, D, or B	6.805	0.8173	91.34	86.13
2B	0.5 gal. benzene (*a*) T, D, or B	6.795	0.8161	94.52	91.75
3A	5 gal. commercially pure methyl alcohol (*b*) T, D, or B	6.781	0.8144	90.48	86.31
3B	1 gal. pine tar (Pix Liquida, U. S. P.) T, D, or B	6.810	0.8179	94.05	91.06
4	1 gal. of the following mixture: 5 gal. of an aqueous solution containing 40% nicotine; 3.6 oz. methylene blue; water to make 100 gal. (*c*) T, D, or B	6.823	0.8195	94.19	91.29
5	65 lbs. ethyl ether; 3 lbs. cadmium iodide; 3 lbs. ammonium iodide B or G	6.777	0.8140	85.50	80.05
6A	15 gal. of condensed fumes recovered in the process of manufacture T, D, or B	.....	.....	.....	.....
6B	0.5 gal. pyridine bases T, D, or B	6.801	0.8169	94.52	91.75
11	100 lbs. sulfuric acid and 10 lbs. cadmium iodide B or G	6.779	0.8142	80.92	75.76
12A	5 gal. benzene T, D, or B	6.820	0.8192	90.47	86.30

(*a*) For use only in closed and continuous process.

(*b*) Approved wood alcohol is wood spirit containing ketones, aldehydes, unsaturated compounds, etc., that render separation very difficult. In order to be approved the wood alcohol must pass general tests for the impurities and must be a wood distillation product. It is for this reason that all uses of Formula 3A are conditional.

(*c*) Specially denatured alcohol formula number 4 authorized for use in the manufacture of cigars or fluids, sprays, or other liquids designed for use in the manufacture of cigars, must be made from rum of not over 150° proof or alcohol distilled at not over 150° proof. Cf. appendix to regulations No. 3.

FORMULAS FOR SPECIALLY DENATURED ALCOHOL

Formula Number	Composition: Giving amounts of denaturants to be added to 100 gallons of 190° proof ethyl alcohol	Properties of Finished Formula: Weight in lbs./gal. at 15.6°C.	Sp. gr. in vac. 15.6°/15.6°C.	% Ethyl alcohol: by vol.	% Ethyl alcohol: by wt.
13A	10 gal. ethyl ether T or D	6.740	0.8095	86.40	81.15
15	3 gal. sulfuric acid and 1 gal. kerosene (*d*) B or G	7.105	0.8532	91.52	87.67
17	0.05 gal. (6.4 fluid oz.) of animal oil (Dippels) T, D, or B	6.795	0.8161	94.94	92.33
18	100 gal. vinegar, containing not less than 9% acetic acid T (wood) or B	7.802	0.9369	48.70	41.27
19	100 gal. ethyl ether D only	6.468	0.7769	47.60	40.25
20	5 gal. crude chloroform (*e*) T, D, or B	7.062	0.8481	90.49	86.32
22	10 gal. U. S. P. formaldehyde solution (*f*) B or G	7.037	0.8451	86.70	81.50
23	10 gal. acetone and 2 gal. benzene T, D, or B	6.797	0.8164	84.82	79.01
23A	10 gal. acetone T, D, or B	6.788	0.8153	86.37	81.11
23B	15 lbs. camphor, U. S. P.; 2 lbs. menthol, U. S. P.; 3 lbs. phenol, U. S. P. B or G	6.827	0.8200	93.50	90.33
23C	10 lbs. phenol, U. S. P.; 15 lbs. resorcinol, U. S. P.; 5 lbs. methyl salicylate, U. S. P. B or G	6.898	0.8285	.....	.....
23D	20 lbs. tannic acid, U. S. P.; 25 lbs. camphor, U. S. P. B or G	6.937	0.8331	90.95	86.92
23E	9 lbs. benzaldehyde, U. S. P.; 1 lb. salicylic acid, U. S. P. B or G	6.840	0.8215	94.02	91.00

(*d*) In manufacturing nitrous ether, after the tax-free alcohol has all been converted into nitrous ether it will be permissible for the manufacturer to add alcohol in order to dilute the product so that it may be more readily transported, or, for other purposes, but such added alcohol must in all cases be tax-paid alcohol.
(*e*) This formula can be used only in the manufacture of chloroform by a continuous process.
(*f*) The amount of denatured alcohol to be used in the finished product must not exceed 20%.

FORMULAS FOR SPECIALLY DENATURED ALCOHOL

Formula Number	Composition: Giving amounts of denaturants to be added to 100 gallons of 190° proof ethyl alcohol	Properties of Finished Formula: Weight in lbs./gal. at 15.6°C.	Sp. gr. in vac. 15.6°/15.6°C.	% Ethyl alcohol: by vol.	% Ethyl alcohol: by wt.

(*m*) Authorized for use in the manufacture of high grade perfumes and toilet waters containing not less than 2% by weight of essential oils, or their equivalent in perfume materials.

FORMULAS FOR SPECIALLY DENATURED ALCOHOL

Formula Number	Composition: Giving amounts of denaturants to be added to 100 gallons of 190° proof ethyl alcohol	Properties of Finished Formula: Weight in lbs./gal. at 15.6°C.	Sp. gr. in vac. 15.6°/15.6°C.	% Ethyl alcohol: by vol.	% Ethyl alcohol: by wt.
45	300 lbs. of white or orange shellac, arsenic and rosin free (*n*) D or B	7.545	0.9061	73.15	65.84
46	25 fluid oz. phenol, U. S. P.; 4 oz. methyl salicylate, U. S. P. B or G	6.805	0.8173	94.83	92.19
47	7 gal. fluid extract arnica flowers, N. F. (4th edition) B or G	6.882	0.8265	88.36	83.60

FORMULAS FOR COMPLETELY DENATURED ALCOHOL

Revised to July, 1936

Formula Number	Composition: Giving amounts of denaturant to be added to 100 parts by volume of ethyl alcohol of not less than 160° proof (*p*)	Properties of Finished Formula: Weight in lbs./gal. at 15.6°C.	Sp. gr. in vac. 15.6°/15.6°C.
11	3 parts by volume of "Pontol-K"(*r*), or a similar compound; 3 parts by volume of "ST-115", or a similar compound; 1 part by volume of gasoline; 0.5 part by volume of "Hydronol" or a similar compound	6.827	0.8198
12	4 parts by volume of "Pontol-K"(*r*), or a similar compound; 2 parts by volume of methyl isobutyl ketone; 1 part by volume of gasoline; 1 part by volume of "Agdite" or a similar compound, or 2 parts by volume of "Hydronol"(*r*), or a similar compound	6.827	0.8198
13	4 parts by volume of "ST-115"(*r*), or a similar compound; 2 parts by volume of methyl isobutyl ketone; 1 part by volume of "Agdite"(*r*), or a similar compound, or 1 part by volume of "Hydronol" or a similar compound	6.827	0.8198

(*n*) Applications to use this formula will be approved only when filed by proprietors of bonded denaturing plants, and such persons will be allowed to sell or dispose of such specially denatured alcohol only after it has been compounded with other ingredients of the character and in the manner approved by the Department. Each application to use specially denatured alcohol Formula No. 45 should show the other ingredients which it is proposed to add and the process to be employed.

(*p*) All types of completely denatured alcohol may be compounded with anhydrous alcohol where required.

(*r*) These are the trade names for denaturants of various manufacturers. Pontol is a DuPont product consisting principally of a mixture of primary and secondary aliphatic higher alcohols and other compounds of characteristic odor and taste. ST-115 is a Tennessee Eastman product, free from wood alcohol, containing a definite proportion of the pyroligneous compounds obtained in the destructive distillation of wood. Hydronol is a DuPont product free from water and suspended materials, having a characteristic taste and odor, and prepared by hydrogenation of organic substances. Agdite, prepared by the Standard Oil Company of California, is a compounded petroleum product free from water and all suspended materials, containing at least 4.5% sulfur.

DIMENSIONAL FORMULAS

Dimensional formulas show the relation of various physical quantities and their units in terms of the fundamental quantities of mass, length, and time. In these equations l = length; m = mass; t = time; θ = angle; ω = solid angle; T = temperature; ψ = luminous flux; ϵ = dielectric constant; μ = magnetic permeability; and v = volume = l^3. In the electrostatic, or *cgse*, system: l = cm.; m = g.; t = mean solar second; T = absolute degree Centigrade; and ϵ = dielectric constant of a vacuum. In the electromagnetic, or *cgsm*, system ϵ is replaced by μ, magnetic permeability.

Absorptivity; coefficient of absorption $[l^{-1}]$
Acceleration $[lt^{-2}]$
Acceleration, angular $[\theta\, t^{-2}]$
Action $[ml^2t^{-1}]$
Angle $[\theta]$
Angle, solid $[\omega]$
Area $[l^2]$
Brightness, surface $[\psi\, l^{-2}\, \omega^{-1}]$
Bulk modulus, *cf.* stress.
Capacity, electrical $[\epsilon l]$; $[\mu^{-1}\, l^{-1}t^2]$
Charge $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{3}{2}}t^{-1}]$; $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}]$
Compressibility $[m^{-1}lt^2]$
Compression, modulus of, *cf.* stress.
Concentration, mass, *cf.* mass concentration.
Concentration, volume, *cf.* density.
Conductivity, electrical mass $[\epsilon\, m^{-1}l^3t^{-1}]$; $[\mu^{-1}m^{-1}l^{\frac{1}{2}}]$
Conductivity, thermal, *cf.* thermal conductivity.
Conductivity, volume $[\epsilon t^{-1}]$; $[\mu^{-1}l^{-2}t]$
Current, electrical $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{3}{2}}t^{-2}]$; $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$
Density $[ml^{-3}]$ or $[mv^{-1}]$
Dielectric constant $[\epsilon]$; $[\mu^{-1}l^{-2}t^2]$
Dielectric strength $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{-\frac{1}{2}}t^{-1}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}]$
Diffusion, coefficient of $[l^2t^{-1}]$
Displacement, total electric, *cf.* charge.
Electrical current, *cf.* current, electrical.
Electric displacement, total, *cf.* charge.
Electrical inductivity $[\epsilon]$; $[\mu^{-1}l^{-2}t^2]$
Electrical potential, *cf.* potential, electrical.
Electrical quantity, *cf.* charge.
Energy $[ml^2t^{-2}]$
Ettinghausen effect, coefficient of $[\epsilon^{-1}m^{-1}l^{-1}t^4T]$; $[\mu m^{-1}lt^2T]$
Field intensity, magnetic, *cf.* magnetic field intensity.
Field strength, electrical, *cf.* dielectric strength.
Fluidity $[m^{-1}lt]$
Flux of induction, *cf.* charge.
Flux, luminous, *cf.* luminous flux.
Flux of magnetic induction; magnetic flux $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{3}{2}}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$
Force $[mlt^{-2}]$
Force, magnetizing, *cf.* magnetizing force.

DIMENSIONAL FORMULAS (Continued)

Force, magnetomotive, *cf.* magnetomotive force.
Force, moment of, *cf.* torque.
Frequency $[t^{-1}]$
Friction, coefficient of skin, *cf.* skin friction, coefficient of.
Hall effect, coefficient of $[\epsilon^{-\frac{1}{2}}m^{-\frac{1}{2}}l^{-\frac{1}{2}}t^{3}]$; $[\mu^{\frac{1}{2}}m^{-\frac{1}{2}}l^{\frac{3}{2}}]$
Heat, *cf.* energy.
Illumination of a surface $[\psi l^{-2}]$
Inductance, electrical $[\epsilon^{-1}l^{-1}t^{2}]$; $[\mu l]$
Induction, flux of, *cf.* charge.
Induction, magnetic, *cf.* magnetic induction.
Inductivity, *cf.* electrical inductivity.
Intensity, luminous, *cf.* luminous intensity.
Intensity of magnetization, *cf.* magnetic induction.
Intensity of radiation, *cf.* radiation, intensity of.
Ionic mobility $[\epsilon^{\frac{1}{2}}m^{-\frac{1}{2}}l^{\frac{3}{2}}]$; $[\mu^{-\frac{1}{2}}m^{-\frac{1}{2}}l^{\frac{3}{2}}t]$
Kinematic viscosity, *cf.* viscosity, kinematic.
Leduc effect, coefficient of $[\epsilon^{-\frac{1}{2}}m^{-\frac{1}{2}}l^{-\frac{1}{2}}t^{2}]$; $[\mu^{\frac{1}{2}}m^{-\frac{1}{2}}l^{\frac{3}{2}}t]$
Length $[l]$
Luminous flux $[\psi]$
Luminous intensity of a source in a given direction $[\psi\omega^{-1}]$
Magnetic field intensity $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}]$; $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{-\frac{1}{2}}t^{-1}]$
Magnetic flux, *cf.* flux of magnetic induction.
Magnetic induction $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{-\frac{1}{2}}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{-\frac{1}{2}}t^{-1}]$
Magnetic induction, flux of, *cf.* flux of magnetic induction.
Magnetic permeability $[\mu]$; $[\epsilon^{-1}l^{-2}t^{2}]$
Magnetic potential, *cf.* magnetomotive potential.
Magnetic potential gradient, *cf.* magnetic field intensity.
Magnetic reluctance $[\epsilon l t^{-2}]$; $[\mu^{-1}l^{-1}]$
Magnetism, quantity of, *cf.* flux of magnetic induction.
Magnetizing force, *cf.* magnetic field intensity.
Magnetomotive force $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}]$; $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$
Mass $[m]$
Mass concentration $[m_1m_2^{-1}]$ (where $m_1 = m_2$, is called titer or is denoted as per cent).
Mass conductivity, electrical, *cf.* conductivity, electrical mass.
Mass resistivity, electrical, *cf.* resistivity, electrical mass.
Mobility, ionic, *cf.* ionic mobility.
Modulus, bulk, *cf.* stress.
Modulus of compression, *cf.* stress.
Modulus of rigidity, *cf.* stress.
Modulus, Young's, *cf.* stress.
Moment of a force, *cf.* torque.
Nernst effect, coefficient of $[\epsilon^{-1}lT^{-1}]$; $[\mu l^{2}t^{-1}T^{-1}]$
Peltier coefficient $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{3}{2}}t^{-2}]$
Per cent, *cf.* mass concentration.
Permeability, *cf.* magnetic permeability.
Piezoelectric constant $[\epsilon^{\frac{1}{2}}m^{-\frac{1}{2}}l^{\frac{1}{2}}t]$; $[\mu^{-\frac{1}{2}}m^{-\frac{1}{2}}l^{-\frac{1}{2}}t^{2}]$
Pole strength, *cf.* flux of magnetic induction.

	$F' = Fc$	$= (2.89247 \pm 0.00030) \times 10^{14}$ abs. e.s.u·g-equiv^{-1}
(2) Physical scale		
	F	$= 96514.0 \pm 10$ abs-coul·g-equiv^{-1}
		$= 9651.4_0 \pm 1.0$ abs. e.m.u·g-equiv^{-1}
	$F' = Fc$	$= (2.89326 \pm 0.00030) \times 10^{14}$ abs. e.s.u·g-equiv^{-1}
Avogadro number (chemical scale)	N_0	$= (6.0228_3 \pm 0.0011) \times 10^{23}$ mole^{-1}
Electronic charge	$e = F/N_0$	$= (1.60203_3 \pm 0.00034) \times 10^{-20}$ abs. e.m.u.
	$e' = ec$	$= (4.8025_1 \pm 0.0010) \times 10^{-10}$ abs. e.s.u.
Specific electronic charge	e/m	$= (1.7592 \pm 0.0005) \times 10^7$ abs. e.m.u·g^{-1}
	$e'/m = ec/m$	$= (5.2736_6 \pm 0.0015) \times 10^{17}$ abs. e.s.u·g^{-1}
Planck constant	h (*see Table C*),	

TABLE A'. Atomic Weights.

(1) Physical scale ($O^{16} = 16.0000$)

$H^1 = 1.00813 \pm 0.00001_7$ $H^2 = 2.01473 \pm 0.00001_9$

$H = 1.00827_6 \pm 0.00001_7$ (from H^1/H^2 abundance $= 6900 \pm 100$)

$He^4 = 4.00389 \pm 0.00007$

$C^{12} = 12.00386 \pm 0.00004$ $C^{13} = 13.00761 \pm 0.00015$

$C = 12.01465 \pm 0.00023$ (from C^{12}/C^{13} abundance $= 92 \pm 2$)

$N^{14} = 14.00753 \pm 0.00005$ $N^{15} = 15.0049 \pm 0.0002$

$N = 14.01121 \pm 0.00009_5$ (from N^{14}/N^{15} abundance $= 270 \pm 6$)

$O^{16} = 16.0000$ $O^{17} = 17.0045$ $O^{18} = 18.0049$

$O = 16.00435_7 \pm 0.00008_6$ (from abundance $O^{16} : O^{18} : O^{17} = (506 \pm 10) : 1 : (0.204 \pm 0.008)$)

(2) Chemical scale ($O = 16.0000$)

Ratio physical to chemical scale

$r = (16.004357 \pm 0.000086)/16 = 1.000272 \pm 0.000005$

$H^1 = 1.00785_6 \pm 0.00001_8$ (from physical scale)

$H^2 = 2.01418_2 \pm 0.00002_1$ (from physical scale)

$H = 1.00800_2 \pm 0.00001_8$ (from physical scale)

$He^4 = 4.00280 \pm 0.00007$ (from physical scale)

$C = 12.01139 \pm 0.00024$ (from physical scale)

$N = 14.00740 \pm 0.00012$ (from physical scale)

$N = 14.0086 \pm 0.0007$ (direct observation)

$Na = 22.994 \pm 0.003$

$Cl = 35.457 \pm 0.001$

$Ca = 40.080 \pm 0.005$

$Ag = 107.880 \pm 0.002$

$I = 126.915 \pm 0.004$

† Unless otherwise specified, all quantities in these tables that involve the mole or the gram equivalent are on the chemical scale of atomic weights.

PROBABLE VALUES OF THE PHYSICAL CONSTANTS

TABLE B. Additional Quantities Evaluated or Used in Connection with TABLE A

Ratio of e.s.u. to e.m.u. (direct)	c'	$= (2.9971_2 \pm 0.0001) \times 10^{10}$ cm$^{\frac{1}{2}}$·sec$^{-\frac{1}{2}}$·int-ohm$^{\frac{1}{2}}$
		$= (2.9978_4 \pm 0.0001_0) \times 10^{10}$ cm·sec^{-1}
Ratio of e.s.u. to e.m.u. (indirect)	$c' = c$	$= (2.99776 \pm 0.00004) \times 10^{10}$ cm·sec^{-1}
Average density of earth	δ	$= 5.517 \pm 0.004$ g·cm^{-3}
Maximum density of water	$\delta_m(H_2O)$	$= 0.999972 \pm 0.000002$ g·cm^{-3}
Acceleration of gravity (standard)	g_0	$= 980.665$ cm·sec^{-2}
Acceleration of gravity (45°)	g_{45}	$= 980.616$ cm·sec^{-2}
Density of oxygen gas (0°C, A_{45})	L_1	$= 1.42897 \pm 0.00003$ g·liter^{-1}
Limiting density of oxygen gas (0°C, A_{45})	$L_{\lim}$	$= 1.427609 \pm 0.000037$ g·liter^{-1}
Factor converting oxygen (0°C, A_{45}) to ideal gas	$1-\alpha$	$= 1.000953_5 \pm 0.000009_4$
International coulomb ($=q$ abs-coul)	q	$= 0.99986 \pm 0.00002$
International gauss ($=q$ abs-gauss)		
International henry ($=p$ abs-henry)	p	$= 1.00048 \pm 0.00002$
International volt ($=pq$ abs-volt)	pq	$= 1.00034 \pm 0.00003$
International joule ($=pq^2$ abs-joule)	pq^2	$= 1.00020 \pm 0.00004_5$
Specific gravity of Hg (0°C, A_0) referred to air-free water at maximum density	ρ_0	$= 13.59542 \pm 0.00005$
Density of Hg (0°C, A_0)	D_0	$= 13.59504_0 \pm 0.00005_7$ g·cm^{-3}
Electrochemical equivalents (chemical scale)		
silver (apparent)	E^*_{Ag}	$= 1.11800 \times 10^{-3}$ g·int-coul^{-1}
(corrected)	E_{Ag}	$= (1.11807 \pm 0.00012) \times 10^{-3}$ g·abs-coul^{-1}
iodine (apparent)	E^*_I	$= (1.315026 \pm 0.000025) \times 10^{-3}$ g·int-coul^{-1}
(corrected)	E_I	$= (1.31535 \pm 0.00014) \times 10^{-3}$ g·abs-coul^{-1}
Effective calcite grating space (18°C.), Siegbahn system	d_{18}''	$= 3.02904 \times 10^{-8}$ cm
True calcite grating space (20°C.), Siegbahn system	d_{20}'	$= 3.02951_2 \times 10^{-8}$ cm
True calcite grating space (20°C.), c.g.s. system	d_{20}	$= (3.03567_4 \pm 0.00018) \times 10^{-8}$ cm
Ratio of grating and Siegbahn scales of wavelengths	λ_0/λ_a	$= 1.002034 \pm 0.000060$
Density of calcite (20°C.)	ρ	$= 2.71029 \pm 0.00003$ g·cm^{-3}
Structural constant of calcite (20°C.)	ϕ	$= 1.09594 \pm 0.00001$
Molecular weight of calcite (chemical scale)	M	$= 100.091_4 \pm 0.005$
Rydberg constant for hydrogen (H^1)	R_H	$= 109677.581_2 \pm 0.007_5$ cm^{-1} (I. A. scale)
Rydberg constant for deuterium (H^2)	R_D	$= 109707.419_3 \pm 0.007_5$ cm^{-1} (I. A. scale)
Rydberg constant for helium	R_{He}	$= 109722.263 \pm 0.012$ cm^{-1} (I. A. scale)
Rydberg constant for infinite mass	R_∞	$= 109737.303 \pm 0.017$ cm^{-1} (I. A. scale) or ± 0.05 cm^{-1} (c.g.s. system)

TABLE C. Partial List of Derived Quantities.*

Planck constant

$$h = \left\{ \frac{2\pi^2 c^3 F^5}{R_\infty N_0^5 (e/m)} \right\}^{\frac{1}{3}} = (6.624_2 \pm 0.002_4) \times 10^{-27} \text{ erg·sec}$$

$$h/e = \left\{ \frac{2\pi^2 c^3 F^2}{R_\infty N_0^2 (e/m)} \right\}^{\frac{1}{3}} = (4.1349_0 \pm 0.0007_1) \times 10^{-7} \text{ erg·sec·abs. e.m.u.}^{-1}$$

$$h/e' = h/ec = \left\{ \frac{2\pi^2 F^2}{R_\infty N_0^2 (e/m)} \right\}^{\frac{1}{3}} = (1.3793_3 \pm 0.0002_3) \times 10^{-17} \text{ erg·sec·abs. e.s.u.}^{-1}$$

Atomic weight of electron $E = F/(e/m)$

(physical scale) $= 5.4862_4 \pm 0.0017) \times 10^{-4}$

(chemical scale) $= (5.4847_5 \pm 0.0017) \times 10^{-4}$

Band spectra constant connecting wave number and moment of inertia

$$h/8\pi^2 c = \left\{ \frac{F^5}{256\pi^4 R_\infty N_0^5 (e/m)} \right\}^{\frac{1}{3}} = (27.98_{65} \pm 0.01_0) \times 10^{-40} \text{ g·cm}$$

Boltzmann constant $k = R_0/N_0 = V_0 A_0/T_0 N_0 = (1.38047_4 \pm 0.00026) \times 10^{-16}$ erg·deg^{-1}

Charge in electrolysis of one gram of H $F/H = 9572.1_{73} \pm 1.0$ abs. e.m.u·g^{-1}

Charge in electrolysis of one gram of H^1 $e/M_{H^1} = F/H^1 = 9573.5_{60} \pm 1.0$ abs. e.m.u·g^{-1}

Compton shift at 90° $h/mc = \left\{ \frac{2\pi^2 F^2 (e/m)^2}{R_\infty N_0^2} \right\}^{\frac{1}{3}} = (0.024265_{14} \pm 0.000005_7) \times 10^{-8}$ cm

Energy in ergs of one abs-volt-electron $E_0 = 10^8 e = 10^8 F/N_0 = (1.60203_3 \pm 0.00034) \times 10^{-12}$ erg

PROBABLE VALUES OF THE PHYSICAL CONSTANTS

Energy in calories per mole for one abs-volt-electron per molecule

$$\frac{F(\text{abs. coul. per gram equiv})}{J_{15}(\text{abs. joules per cal})} = 23052.85 \pm 3.2 \text{ cal}_{15} \cdot \text{mole}^{-1}$$

Fine structure constant.... $\alpha = 2\pi(e')^2/hc = \left\{\frac{4\pi R_\infty F(e/m)}{N_0}\right\}^{\frac{1}{3}} = (7.2976_6 \pm 0.0008_6) \times 10^{-3}$

$$1/\alpha = 137.030_2 \pm 0.016$$

$$\alpha^2 = (5.3256 \pm 0.0013) \times 10^{-5}$$

Gas constant per mole..... $R_0 = V_0A_0/T_0 = (8.31436 \pm 0.00038) \times 10^7 \text{ erg} \cdot \text{deg}^{-1} \cdot \text{mole}^{-1}$

$$R_0' = R_0 \cdot 10^{-7}/J_{15} = 1.98646_7 \pm 0.00021 \text{ cal}_{15} \cdot \text{deg}^{-1} \cdot \text{mole}^{-1}$$

$$R_0'' = V_0'/T_0 = (8.20544_7 \pm 0.00037) \times 10^{-2} \text{ liter} \cdot \text{atmos} \cdot \text{deg}^{-1} \cdot \text{mole}^{-1}$$

$$R_0''' = R_0/A_0 = V_0/T_0 = 82.0566_7 \pm 0.0037 \text{ cm}^3 \cdot \text{atmos} \cdot \text{deg}^{-1} \cdot \text{mole}^{-1}$$

also $R_0T_0 = V_0A_0 = (2.27115_0 \pm 0.00006) \times 10^{10} \text{ erg} \cdot \text{mole}^{-1}$

Loschmidt number (0°C, A_0)..... $n_0 = N_0/V_0 = (2.6870_{12} \pm 0.0005_0) \times 10^{19} \text{ atmos}^{-1} \text{ cm}^{-3}$

Magnetic moment of one Bohr magneton..... $\mu_1 = (h/4\pi)(e/m) = \frac{1}{4\pi}\left\{\frac{2\pi^2c^3F^5(e/m)^2}{R_\infty N_0^5}\right\}^{\frac{1}{3}}$

$$= (0.9273_{45} \pm 0.0003_7) \times 10^{-20} \text{ erg} \cdot \text{gauss}^{-1}$$

Magnetic moment per mole for one Bohr magneton per molecule..... $\mu_1 N_0 = \frac{1}{4\pi}\left\{\frac{2\pi^2c^3F^5(e/m)^2}{R_\infty N_0^2}\right\}^{\frac{1}{3}} = 5585.2_4 \pm 1.6 \text{ erg. gauss}^{-1} \cdot \text{mole}^{-1}$

Mass of α-particle..... $M\alpha = (\text{He} - 2E)/N_0 = (6.6442_2 \pm 0.0012) = 10^{-24} \text{ g}$

Mass of atom of unit atomic weight.... $M_0 = 1/N_0 = (1.66035 \pm 0.00031) \times 10^{-24} \text{ g}$

Mass of electron.. $m = e/(e/m) = (F/N_0)/(e/m) = (9.1066_0 \pm 0.0032) \times 10^{-28} \text{ g}$

Mass of H^1 atom..... $M_{H^1} = H^1/N_0 = (1.67339_3 \pm 0.00031) \times 10^{-24} \text{ g}$

Mass of proton..... $M_p = (H^1 - E)/N_0 = (1.67248_2 \pm 0.00031) \times 10^{-24} \text{ g}$

Radiation density constant..... $a = 8\pi^5k^4/15c^3h^3 = \left(\frac{V_0A_0}{T_0}\right)^4 \frac{4\pi^3N_0R_\infty(e/m)}{15c^6F^5}$

$$= (7.569_{42} \pm 0.004_9) \times 10^{-15} \text{ erg} \cdot \text{cm}^{-3} \cdot \text{deg}^{-4}$$

Ratio mass H^1 atom to mass electron..... $M_{H^1}/m = (e/m)(H^1/F) = 1837.5_{61} \pm 0.5_6$

Ratio mass proton to mass electron..... $M_p/m = (e/m)\left(\frac{H^1 - E}{F}\right) = 1836.5_{61} \pm 0.5_6$

Second radiation constant.... $c_2 = hc/k = \frac{c^2T_0}{V_0A_0}\left\{\frac{2\pi^2F^5}{R_\infty N_0^2(e/m)}\right\}^{\frac{1}{3}} = 1.4384_8 \pm 0.0003_4 \text{ cm} \cdot \text{deg}$

Specific charge of α-particle... $2e/M\alpha = \frac{2F}{\text{He} - 2E} = 4822.3_3 \pm 0.5_1 \text{ abs. e.m.u} \cdot \text{g}^{-1}$

Specific charge of proton..... $e/M_p = \frac{F}{H^1 - E} = 9578.7_7 \pm 1.0 \text{ abs. e.m.u} \cdot \text{g}^{-1}$

Stefan-Boltzmann constant..... $\sigma = ac/4 = 2\pi^5k^4/15c^2h^3 = \left(\frac{V_0A_0}{T_0}\right)^4 \frac{\pi^3N_0R_\infty(e/m)}{15(Fc)^5}$

$$= (5.672_{83} \pm 0.003_7) \times 10^{-5} \text{ erg} \cdot \text{cm}^{-2} \cdot \text{deg}^{-4} \cdot \text{sec}^{-1}$$

Wave-length associated with one abs-volt** $\lambda_0 = 10^{-8}c^2(h/e') = \frac{c^2}{10^8}\left\{\frac{2\pi^2F^2}{R_\infty N_0^2(e/m)}\right\}^{\frac{1}{3}} = (12395.4 \pm 2.1) \times 10^{-8} \text{ cm} \cdot \text{abs-volt}$

Wave number associated with one abs-volt $s_0 = 1/\lambda_0 = \frac{10^8}{c^2}\left\{\frac{R_\infty N_0^2(e/m)}{2\pi^2F^2}\right\}^{\frac{1}{3}} = 8067.4_9 \pm 1.4 \text{ cm}^{-1} \cdot \text{abs-volt}^{-1}$

Wien's displacement law constant***..... $A = c_2/4.965114 = 0.28971_8 \pm 0.00007 \text{ cm} \cdot \text{deg}$

Zeeman displacement per gauss..... $(e/m)/4\pi c = (4.6699_1 \pm 0.0013) \times 10^{-5} \text{ cm}^{-1} \cdot \text{gauss}^{-1}$

* In order to be able to calculate, by propagation of errors, the probable error in a derived quantity, it is necessary to express the quantity explicitly in terms of the various fundamental quantities of Table A, or of Table B, and that has been done in each case. Since in this paper e and h are treated as derived quantities, they do not therefore appear in such explicit expressions. But in calculating *numerical* values of derived quantities, the work can often be greatly simplified by using the values of other previously calculated derived quantities—in particular e and h. In order to show how certain derived quantities depend on quantities like e and h, such alternative expressions are given in many cases.

** The factor 10^{-8} was accidentally omitted in G.C. 1929, in the equation for λ_0.

*** The factor 4.965114 is the root of $e^{-\beta} + (\beta/5) - 1 = 0$.

TANK AND PIPE CAPACITIES

VERTICAL TANKS

Cf. McCrea, *News Ed., Ind. Eng. Chem. 18, 451 (1940)* by permission.

Cylindrical tanks of diameter D and depth d in inches:

(1) Gallons $= (0.00340 \times D^2) \times d$
(2) Liters $= (0.01288 \times D^2) \times d$

Rectangular tanks of base area A and depth d in inches:

(1) Gallons $= (0.00433 \times A) \times d$
(2) Liters $= (0.0164 \times A) \times d$

For any one tank the expression within the parentheses is a constant. The constant multiplied by any liquid depth gives the liquid contents. This is particularly advantageous in setting a gauge for fluctuating volumes.

HORIZONTAL CYLINDRICAL TANKS

Cf. Davis, *Chemist Analyst 25, No. 4, p. 87 (1936)* by permission.

The volume of liquid contents in a cylindrical tank resting upon its side in a horizontal position is equal to the product of the length of the tank multiplied by the area of the "wetted" portion of an end. This area is that of a segment of a circle and is $\frac{1}{2}R^2(\theta - \sin\theta)$ where θ in radians, is equal to $2\cos^{-1}[(R-d)/R]$ and where R is the radius of the circle and d is the depth of the segment as in figure 1a.

Figure 1b on the following page can be used for converting percentage diameter to percentage volume.

Example. To find the liquid contents of a cylindrical tank 6 ft., 8 in. (6⅔ ft. = 20/3 ft. = 80 in.) in diameter and 10 ft. long resting upon its side in a horizontal position with liquid contents to a depth of 24 inches.

The total volume of this tank is $\frac{1}{4}\pi(20/3)^2 \times 10 = 349$ cu. ft. The liquid depth is 24/80 or 30% of the diameter. On figure 1b, opposite 30% on the diameter scale is read 25% on the volume scale. This means that the liquid contents are 25% of 349 cu. ft. or 87.3 cu. ft.

Example. To find the depth of liquid when this same tank contains 241 cu. ft. of liquid contents.

Two hundred and forty-one cu. ft. is 241/349 or 69% of the total capacity of the tank. Reference to figure 1b shows that 69% of the volume corresponds to 65.0% of the diameter. This means that 241 cu. ft. of liquid will show a depth of 65% of 80 inches or 52.0 inches.

PIPES

Cf. Schaphorst, *News Ed., Ind. Eng. Chem. 18, 109 (1940)* by permission.

Figure 2 on the following page can be used to find the volume in U. S. gallons of any given length of all the standard pipe sizes from ⅛ inch to 15 inches. In this figure, line A shows the standard pipe sizes, line B shows lengths of pipe from 0.1 to 800,000 feet, and line C shows volumes from 1 to 1000 gallons. A straight line through the pipe size on line A and through the length of pipe on line B will intersect line C at the number of gallons contained. Thus, the broken line in the figure is representative of a 2½-inch pipe (on A) of 400 feet length (on B) which intersects C at 100 gallons, the capacity of the pipe line. In the same manner, knowing any of two other variables, the third may be found. Even values lying at points beyond the limits of the figure may be found, as for example: To determine the volume of a ½-inch pipe 1 foot long, a straight line is run through the ½-inch point on A and the 10,000-point on B. The intersection on C shows 160 gallons which is the capacity of a pipe 10,000 feet in length. By merely dividing this capacity by 10,000 will give 0.016 gallons as the volume of a 1 foot length.

For conversion of U. S. Gallons into other units of capacity, see special table of *Conversion Factors.*

Figure 1b

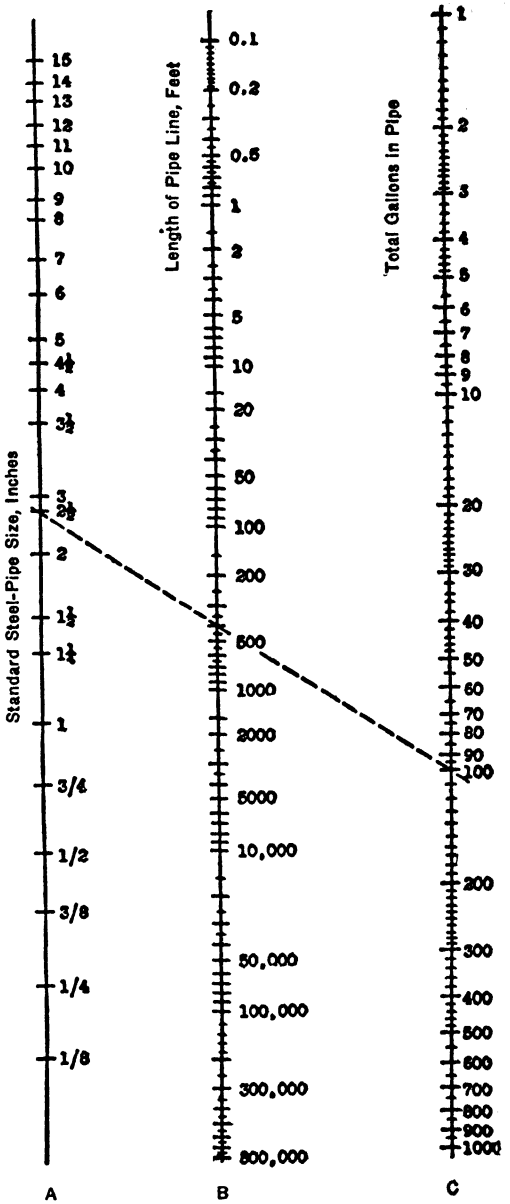

Figure 2

CONVERSION OF WEIGHINGS IN AIR TO WEIGHINGS IN VACUO

If the mass of a substance in air is M_f, its density D_m, the density of weights used in making the weighing D_w, and the density* of air D_a, the true mass of the substance is vacuo, M_{vac} is

$$M_{vac} = M_f + D_a M_f \left(\frac{1}{D_m} - \frac{1}{D_w} \right)$$

For most purposes it is sufficient to assume a density of 8.4 for brass weights, and a density of 0.0012 for air under ordinary conditions. The equation then becomes

$$M_{vac} = M_f + 0.0012 M_f \left(\frac{1}{D_m} - \frac{1}{8.4} \right)$$

This table which follows gives the values of k (buoyancy reduction factor), which is the correction necessary because of the buoyant effect of the air upon the object weighed; the table is computed for air with the density of 0.0012; m is the weight in grams of the object when weighed in air; weight of object reduced to "in vacuo" $= m + \frac{km}{1000}$

USE OF COINS AS WEIGHTS

(Approximate values for United States coins.)

One 50¢ piece = 12.5 grams = 200 grains (avoir.)
One 25¢ piece = 6.25 grams = 100 grains (avoir.)
One 10¢ piece = 2.5 grams = 40 grains (avoir.)
One 5¢ piece = 5 grams = 80 grains (avoir.)
One 1¢ piece = 3.1 grams = 50 grains (avoir.)
One 10¢ piece + two 50¢ pieces = 27.5 grams = 440 grains, or approximately one ounce; i. e. 437.5 grains.

HOUSEHOLD UNITS

(Approximate values.)

1 Pint = 2 cups = 0.47 liter
1 Cup = 16 tablespoons = 0.5 pint = 237 ml
1 Tablespoon = 3 teaspoons = 15 ml
1 Teaspoon = 4.9 ml

FACTORS FOR REDUCING GAS VOLUMES TO NORMAL

Examples:—(a) 20 cc of dry gas at 22°C. and 730 mm = 20×0.8888 = 17.78 cc at 0°C. and 760 mm. (b) 20 cc of a gas over water at 22° and 730 mm = 20× (factor corrected for aqueous tension; i.e. 730−19.8 or 710.2 mm) = 20cc of dry

CONVERSION OF THERMOMETER SCALES

The following abbreviations are used: F, degrees Fahrenheit; C, degrees Centigrade; R, degrees Reaumur; A.K, degrees Kelvin; A.R, degrees Rankine; Z, degrees on any scale; (f. p.)"Z", the freezing point of water on the Z scale; (b.p.)"Z", the boiling point of water on the Z scale. Cf. Dodds, *Chemical and Metallurgical Engineering*, Vol. 38, p. 476 (1931).

$$\frac{F-32}{180}=\frac{C}{100}=\frac{R}{80}=\frac{A_K-273}{100}=\frac{A_R-460}{180}=\frac{Z-(f.p.)\text{"Z"}}{(b.p.)\text{"Z"}-(f.p.)\text{"Z"}}$$

Examples: (1) To find the Fahrenheit temperature corresponding to −20°C:

$$\frac{F-32}{180}=\frac{C}{100}\text{ or }\frac{F-32}{180}=\frac{-20}{100};\text{ i.e., }-20°C=-4°F$$

(2) To find the Reaumur temperature corresponding to 20°F:

$$\frac{F-32}{180}=\frac{R}{80}\text{ or }\frac{20-32}{180}=\frac{R}{80};\text{ i.e., }20°F=-5.33°R$$

(3) To find the correct temperature on a thermometer reading 80°C and which shows a reading of −0.30°C in melting ice and 99.0°C. in steam at 760mm pressure:

$$\frac{C}{100}=\frac{Z-(f.p.)\text{"Z"}}{(b.p.)\text{"Z"}-(f.p.)\text{"Z"}}=\frac{80-(-0.30)}{99.0-(0.30)};\text{ i.e., }C=80.87°\text{ (corrected)}$$

The reading of any inaccurate thermometer can be corrected and converted in this manner into a reading on any of the other scales; thus, in the example (3) above, to convert into a Fahrenheit scale:

$$\frac{F-32}{180}=\frac{80-(-0.30)}{99\,0-(-0.30)};\text{ i.e., }F=177.56°\text{ (corrected)}$$

Centigrade to Fahrenheit

Formula: (°C×9/5)+32=°F Examples: (1) To convert 60°C to °F, (60×9/5)+32=140°F
(2) To convert −20°C to °F, (−20×9/5)+32=−4°F
(See also special table)

Centigrade to Reaumur

Formula: °C×4/5=°R Examples: (1) To convert 40°C to °R, 40×4/5=32°R
(2) To convert −30°C to °R, −30×4/5=−24°R

Centigrade to Centigrade Absolute or Kelvin

Formula: °C+273.1=°K Examples: (1) To convert 20°C to °K, 20+273.1=293.1°K
(2) To convert −20°C to °K, −20+273.1=253.1°K

Fahrenheit to Centigrade

Formula: (°F−32)×5/9=°C Examples: (1) To convert 140°F to °C, (140−32)×5/9=60°C
(2) To convert −76°F to °C, (−76−32)×5/9=−60°C
(See also special table)

Fahrenheit to Reaumur

Formula: (°F−32)×4/9=°R Examples: (1) To convert 41°F to °R, (41−32)×4/9=4°R
(2) To convert −13°F to °R, (−13−32)×4/9=−20°R

Fahrenheit to Fahrenheit Absolute or Rankine

Formula: °F+459.58=°R′ Examples: (1) To convert 20°F to °R′, 20+459.58=479.58°R′
(2) To convert −20°F to °R′, −20+459.58=439.58°R′

Reaumur to Centigrade

Formula: °R×5/4=°C Examples: (1) To convert 32°R to °C, 32×5/4=40°C
(2) To convert −24°R to °C, −24×5/4=−30°C

Reaumur to Fahrenheit

Formula: (°R×9/4)+32=°F Examples: (1) To convert 8°R to °F, (8×9/4)+32=50°F
(2) To convert −8°R to °F, (−8×9/4)+32=14°F
(3) To convert −20°R to °F, (−20×9/4)+32=−13°F

TEMPERATURE CONVERSION TABLES

The column of figures in bold and which is headed "Reading in °F. or °C. to be converted" refers to the temperature either in degrees Fahrenheit or Centigrade which it is desired to convert into the other scale. If converting from Fahrenheit degrees to Centigrade degrees the equivalent temperature will be found in the column headed "°C." while if converting from degrees Centigrade to degrees Fahrenheit, the equivalent temperature will be found in the column headed "°F." This arrangement is very similar to that of Sauveur and Boylston, copyrighted 1920 and is published with their permission.

HYDROMETER CONVERSION TABLES

This table gives the relation between density (C.G.S.) and degrees on the Baumé and Twaddell scales. The Twaddell scale is never used for densities less than unity. See also section on *Hydrometers*.

Density	Degrees Baumé Bu. Stand. Scale	Degrees Baumé A.P.I. Scale
0.600	103.33	104.33
0.605	101.40	102.38

VISCOSITY CONVERSION TABLE

Poise = c. g. s. unit of absolute viscosity. Centipoise = 0.01 poise.
Stoke = c. g. s. unit of kinematic viscosity. Centistoke = 0.01 stoke.
Centipoises = centistokes × density (at temperature under consideration).
Reyn (1 lb. sec. per sq. in.) = 69 × 10^5 centipoises.

CENTISTOKES TO SAYBOLT, REDWOOD AND ENGLER UNITS

Cf. *Jour. Inst. Pet. Tech., Vol. 22, p. 21 (1936); Reports of A. S. T. M. Committee D-2, 1936 and 1937.*

38	176.7	177.0	177.9	155.0	156.2	158.3	5.08
40	185.7	186.0	187.0	163.0	164.3	166.7	5.34
42	194.7	195.1	196.1	171.0	172.3	175.0	5.59
44	203.8	204.2	205.2	179.1	180.4	183.3	5.85
46	213.0	213.4	214.5	187.1	188.5	191.7	6.11
48	222.2	222.6	223.8	195.2	196.6	200.0	6.37
50	231.4	231.8	233.0	203.3	204.7	208.3	6.63
60	277.4	277.9	279.3	243.5	245.3	250.0	7.90
70	323.4	324.0	325.7	283.9	286.0	291.7	9.21
80	369.6	370.3	372.2	323.9	326.6	333.4	10.53
90	415.8	416.6	418.7	364.4	367.4	375.0	11.84
100*	462.0	462.9	465.2	404.9	408.2	416.7	13.16

* At higher values use the same ratio as above for 100 centistokes; *e.g.*, 102 centistokes = 102 × 4.620 Saybolt seconds at 100°F.

To obtain the Saybolt Universal viscosity equivalent to a kinematic viscosity determined at *t*°F., multiply the equivalent Saybolt Universal viscosity at 100°F. by 1 + (t − 100) 0.000064; *e.g.*, 10 centistokes at 210°F are equivalent to 58.8 × 1.0070, or 59.2 Saybolt Universal seconds at 210°F.

THREE HUNDRED YEAR CALENDAR

1753 to 2052

To find the day of the week:—First find the year in the table and then in the same horizontal column to the right find the month where the number is given which refers to the corresponding column of days in the table which follows.

Example:—To find the day of the week corresponding to Armistice Day, November 11, 1918 find the year 1918 and in the horizontal column to the right under November is the figure 5 which refers to column 5 which is the calendar for November of 1918 which shows that November 11, 1918 was on Monday.

	January	February	March	April	May	June	July	August	September	October	November	December
1761 1767 1778 1789 1795 1801 1807 1818 1829 1835 1846 1857 1863 1874 1885 1891 1903 1914 1925 1931 1942 1953 1959 1970 1981 1987 1998 2009 2015 2026 2037 2043	4	7	7	3	5	1	3	6	2	4	7	2

APPENDIX

MATHEMATICAL TABLES AND FORMULAS

COMPILED BY

RICHARD STEVENS BURINGTON, Ph. D.

ASSISTANT PROFESSOR OF MATHEMATICS

CASE SCHOOL OF APPLIED SCIENCE

CLEVELAND

This MATHEMATICAL APPENDIX *may also be obtained in a separately bound volume and printed on a heavier grade of paper to withstand hard usage. Price $1.25 when ordered direct from* HANDBOOK PUBLISHERS, INC., *Sandusky, Ohio. U. S. A.*

PART ONE

Formulas and Theorems from Elementary Mathematics

I. ALGEBRA

1. Fundamental Laws.

(*a*) Commutative law: $a + b = b + a,\ ab = ba.$

(*b*) Associative law: $a + (b + c) = (a + b) + c,\ a(bc) = (ab)c.$

(*c*) Distributive law: $a(b + c) = ab + ac.$

2. Laws of Exponents.

$a^x \cdot a^y = a^{x+y},\quad (ab)^x = a^x \cdot b^x,\quad (a^x)^y = a^{xy}.$

$a^0 = 1 \text{ if } a \neq 0,\quad a^{-x} = \frac{1}{a^x},\quad \frac{a^x}{a^y} = a^{x-y}.$

$a^{\frac{x}{y}} = \sqrt[y]{a^x},\quad a^{\frac{1}{y}} = \sqrt[y]{a}.$

3. Operations with Zero.

$a - a = 0,\quad a \cdot 0 = 0 \cdot a = 0.$

If $a \neq 0,\ \frac{0}{a} = 0,\ 0^a = 0,\ a^0 = 1.$ (Division by zero undefined.)

4. Complex Numbers (a number of the form $a + bi$, where a and b are real).

$i = \sqrt{-1},\quad i^2 = -1,\quad i^3 = -i,\quad i^4 = 1,\quad i^5 = i,$ etc.

$a + bi = c + di,$ if and only if $a = c,\ b = d.$

$(a + bi) + (c + di) = (a + c) + (b + d)i.$

$(a + bi)\,(c + di) = (ac - bd) + (ad + bc)i.$

$$\frac{a+bi}{c+di} = \frac{(a+bi)\,(c-di)}{(c+di)\,(c-di)} = \frac{ac+bd}{c^2+d^2} + \frac{bc-ad}{c^2+d^2}\,i.$$

5. Laws of Logarithms (See explanation of Table 1).

If M, N, b are positive numbers and $b \neq 1$:

$$\log_b MN = \log_b M + \log_b N, \qquad \log_b \frac{M}{N} = \log_b M - \log_b N,$$

$$\log_b M^p = p \cdot \log_b M, \qquad \log_b \sqrt[q]{M} = \frac{1}{q} \cdot \log_b M,$$

$$\log_b\left(\frac{1}{M}\right) = -\log_b M, \qquad \log_b b = 1, \quad \log_b 1 = 0.$$

Change of base of Logarithms ($c \neq 1$):

$$\log_b M = \log_c M \cdot \log_b c = \frac{\log_c M}{\log_c b}.$$

6. Binomial Theorem (n a positive integer).

$$(a+b)^n = a^n + na^{n-1}b + \frac{n(n-1)}{2!}a^{n-2}b^2 + \frac{n(n-1)(n-2)}{3!}a^{n-3}b^3 + \cdots + nab^{n-1} + b^n$$

where

$$n! = \underline{|n} = 1 \cdot 2 \cdot 3 \cdot \cdots \cdot (n-1)n.$$

7. Expansions and Factors.

$$(a \pm b)^2 = a^2 \pm 2ab + b^2.$$

$$(a \pm b)^3 = a^3 \pm 3a^2 b + 3ab^2 \pm b^3.$$

$$(a+b+c)^2 = a^2 + b^2 + c^2 + 2ab + 2ac + 2bc.$$

$$a^2 - b^2 = (a-b)(a+b).$$

$$a^3 - b^3 = (a-b)(a^2 + ab + b^2).$$

$$a^3 + b^3 = (a+b)(a^2 - ab + b^2).$$

$$a^n - b^n = (a-b)(a^{n-1} + a^{n-2}b + \cdots + b^{n-1}).$$

$a^n - b^n = (a+b)(a^{n-1} - a^{n-2}b + \cdots - b^{n-1})$, for n an even integer.

$a^n + b^n = (a+b)(a^{n-1} - a^{n-2}b + \ldots + b^{n-1})$, for n an odd integer.

$$a^4 + a^2b^2 + b^4 = (a^2 + ab + b^2)(a^2 - ab + b^2).$$

8. Ratio and Proportion.

If $a : b = c : d$ or $\frac{a}{b} = \frac{c}{d}$, then $ad = bc$, $\frac{a}{c} = \frac{b}{d}$.

If $\frac{a}{b} = \frac{c}{d} = \frac{e}{f} = \cdots = k$, then

$$k = \frac{a + c + e + \cdots}{b + d + f + \cdots} = \frac{pa + qc + re + \cdots}{pb + qd + rf + \cdots}.$$

9. Constant Factor of Proportionality (or Variation), k.

If y varies directly as x, or y is proportional to x,

$$y = kx.$$

If y varies inversely as x, or y is inversely proportional to x,

$$y = \frac{k}{x}.$$

If y varies jointly as x and z,

$$y = kxz.$$

If y varies directly as x and inversely as z,

$$y = \frac{kx}{z}.$$

10. Arithmetic Progression.

$$a, \quad a + d, \quad a + 2d, \quad a + 3d, \cdots.$$

If a is the first term, d the common difference, n the number of terms, l the last term and s the sum of n terms,

$$l = a + (n - 1)\,d, \quad s = \frac{n}{2}(a + l).$$

The *arithmetic mean* of a and b is $(a + b)/2$.

11. Geometric Progression.

$$a, \; ar, \; ar^2, \; ar^3, \cdots.$$

If a is the first term, r the common ratio, n the number of terms, l the last term, and S_n the sum of n terms,

$$l = ar^{n-1}, \quad S_n = a\left(\frac{r^n - 1}{r - 1}\right) = \frac{rl - a}{r - 1}.$$

If $r^2 < 1$, S_n approaches the limit S_∞ as n increases without limit,

$$S_\infty = \frac{a}{1 - r}.$$

The *geometric mean* of a and b is $\sqrt{ab}$.

12. Harmonic Progression. A sequence of numbers whose reciprocals form an arithmetic progression is called an *harmonic* progression. Thus,

$$\frac{1}{a}, \quad \frac{1}{a+d}, \quad \frac{1}{a+2d}, \cdots.$$

The *harmonic mean* of a and b is $2ab/(a+b)$.

13. Permutations. Each different arrangement of all or a part of a set of things is called a *permutation.* The number of permutations of n things taken r at a time is

$$_nP_r = n(n-1)(n-2)\cdots(n-r+1) = \frac{n!}{(n-r)!},$$

where

$$n! = n(n-1)(n-2)\cdots(1).$$

14. Combinations. Each of the groups or relations which can be made by taking part or all of a set of things, without regard to the arrangement of the things in a group, is called a *combination.* The number of combinations of n things taken r at a time is

$$_nC_r = \binom{n}{r} = \frac{_nP_r}{r!} = \frac{n(n-1)\cdots(n-r+1)}{r(r-1)\cdots(1)} = \frac{n!}{r!(n-r)!}.$$

15. Probability. If an event may occur in p ways, and may fail in q ways, all ways being equally likely, the *probability* of its occurrence is $p/(p+q)$, and that of its failure to occur is $q/(p+q)$.

16. Remainder Theorem (See §30). If the polynomial $f(x)$ is divided by $(x-a)$, the remainder is $f(a)$. Hence, if a is a root of the equation $f(x) = 0$, then $f(x)$ is divisible by $(x-a)$.

17. Determinants. The determinant D of order n,

$$D = \begin{vmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{vmatrix},$$

is defined to be the sum

$$\Sigma\,(\pm)\, a_{1i}\, a_{2j}\, a_{3k} \cdots a_{nl}$$

of $n!$ terms, the sign in a given term being taken plus or minus according as the number of inversions (of the numbers $1, 2, 3, \cdots, n$) in the corresponding sequence $i, j, k, \cdots, l$, is even or odd.

The *cofactor* A_{ij} of the element a_{ij} is defined to be the product of $(-1)^{i+j}$ by the determinant obtained from D by deleting the ith row and the jth column.

The following theorems are true:

(*a*) If the corresponding rows and columns of D be interchanged, D is unchanged.

(*b*) If any two rows (or columns) of D be interchanged, D is changed to $-D$.

(*c*) If any two rows (or columns) are alike, then $D = 0$.

(*d*) If each element of a row (or column) of D be multiplied by m, the new determinant is equal to mD.

(*e*) If to each element of a row (or column) is added m times the corresponding element in another row (or column), D is unchanged.

(*f*) $D = a_{1j} A_{1j} + a_{2j} A_{2j} + \cdots + a_{nj} A_{nj}, \quad j = 1, 2, \cdots, n.$

(*g*) $0 = a_{1k} A_{1j} + a_{2k} A_{2j} + \cdots + a_{nk} A_{nj}$, if $j \neq k$.

(*h*) The solution of the system of equations

$$a_{i1} x_1 + a_{i2} x_2 + \cdots + a_{in} x_n = c_i, \quad i = 1, 2, \cdots, n,$$

is unique if $D \neq 0$. The solution is given by the equations

$$Dx_1 = C_1, \qquad Dx_2 = C_2, \cdots, \qquad Dx_n = C_n,$$

where C_k is what D becomes when the elements of its kth column are replaced by $c_1, c_2, \ldots, c_n$, respectively.

Example 1.

$$\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = a_{11} \begin{vmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{vmatrix} - a_{12} \begin{vmatrix} a_{21} & a_{23} \\ a_{31} & a_{33} \end{vmatrix} + a_{13} \begin{vmatrix} a_{21} & a_{22} \\ a_{31} & a_{32} \end{vmatrix}$$

$$= a_{11}(a_{22} a_{33} - a_{32} a_{23}) - a_{12}(a_{21} a_{33} - a_{31} a_{23}) + a_{13}(a_{21} a_{32} - a_{31} a_{22}).$$

Example 2. Find the values of x_1, x_2, x_3, which satisfy the system

$$\begin{aligned} 2x_1 + x_2 - 2x_3 &= -6, \\ x_1 + x_2 + x_3 &= 2, \\ -x_1 - 2x_2 + 3x_3 &= 12. \end{aligned}$$

By 17(*h*), we find

$$x_1 = \frac{\begin{vmatrix} -6 & 1 & -2 \\ 2 & 1 & 1 \\ 12 & -2 & 3 \end{vmatrix}}{\begin{vmatrix} 2 & 1 & -2 \\ 1 & 1 & 1 \\ -1 & -2 & 3 \end{vmatrix}} = \frac{8}{8} = 1; \quad x_2 = \frac{\begin{vmatrix} 2 & -6 & -2 \\ 1 & 2 & 1 \\ -1 & 12 & 3 \end{vmatrix}}{\begin{vmatrix} 2 & 1 & -2 \\ 1 & 1 & 1 \\ -1 & -2 & 3 \end{vmatrix}} = \frac{-16}{8} = -2; \quad x_3 = \frac{\begin{vmatrix} 2 & 1 & -6 \\ 1 & 1 & 2 \\ -1 & -2 & 12 \end{vmatrix}}{\begin{vmatrix} 2 & 1 & -2 \\ 1 & 1 & 1 \\ -1 & -2 & 3 \end{vmatrix}} = 3.$$

Interest, Annuities, Sinking Funds.

In this section, n is the number of years, and r the rate of interest expressed as a decimal.

18. Amount. The amount (A_n) of a principal (P) placed at a rate of interest (r) for n years is given as follows.

At simple interest: $A_n = P(1+ nr)$.

At interest compounded annually:* $A_n = P(1 + r)^n$.

At interest compounded q times a year: $A_n = P\left(1 + \frac{r}{q}\right)^{nq}$.

19. Nominal and Effective Rates. The rate of interest quoted in describing a given variety of compound interest is called the *nominal rate.* The rate per year at which principal grows under this investment is called the *effective rate.* The effective rate (i) corresponding to the rate (r), compounded q times a year on a principal of P dollars, is:

$$i = \left(1 + \frac{r}{q}\right)^q - 1.$$

20. Present Value. The present value (P) of an amount A_n due in n years at rate r.

At simple interest: $P = \frac{A_n}{1 + nr}$.

At interest compounded annually:† $P = \frac{A_n}{(1 + r)^n}$.

At interest compounded q times a year: $P = \frac{A_n}{\left(1 + \frac{r}{q}\right)^{nq}}$.

21. True Discount. The true discount is:

$$D = A_n - P.$$

22. Annuity. A fixed sum of money paid at regular intervals is called an *annuity.*

23. Amount of an Annuity.‡ The amount of an annuity (N) of P dollars per annum for n years, beginning one year hence, at rate r, compounded annually, is:

$$N = P \cdot \frac{(1 + r)^n - 1}{r}.$$

---

* See Table XIX. † See Table XX ‡ See Table XXI.

24. Present Value of an Annuity.* The present value (P) of an annuity of N dollars payable annually for n years, beginning a year hence, drawing interest at rate (r), interest compounded annually is:

$$P = N \cdot \frac{(1 + r)^n - 1}{r(1 + r)^n}.$$

25. Amount of a Sinking Fund. The amount (S) of a sinking fund created by a fixed investment (N) placed annually at compound interest (r) for a term of n years, the first investment being made at end of first year, is:

$$S = N \cdot \frac{(1 + r)^n - 1}{r}.$$

26. Fixed Investment. The amount (N) that must be placed annually (end of the year) at compound interest (r) for a term of n years to create a sinking fund (S), is:

$$N = S \cdot \frac{r}{(1 + r)^n - 1}.$$

Algebraic Equations†

27. Quadratic Equations. If

$$ax^2 + bx + c = 0, \quad a \neq 0,$$

then

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.$$

If a, b, c are real and

if $b^2 - 4ac > 0$, the roots are real and unequal.

if $b^2 - 4ac = 0$, the roots are real and equal.

if $b^2 - 4ac < 0$, the roots are imaginary.

28. Cubic Equations. The cubic equation

$$y^3 + py^2 + qy + r = 0,$$

may be reduced by the substitution

$$y = \left(x - \frac{p}{3}\right)$$

* See Table XXII.

† For linear equations, see § 17.

to the normal form

$$x^3 + ax + b = 0,$$

where

$$a = \frac{1}{3}(3q - p^2), \quad b = \frac{1}{27}(2p^3 - 9pq + 27r),$$

which has the solutions $x_1, x_2, x_3,$

$$x_1 = A + B, \quad x_2, \quad x_3 = -\frac{1}{2}(A + B) \pm \frac{i\sqrt{3}}{2}(A - B),$$

where

$$i^2 = -1, \quad A = \sqrt[3]{-\frac{b}{2} + \sqrt{\frac{b^2}{4} + \frac{a^3}{27}}}, \quad B = \sqrt[3]{-\frac{b}{2} - \sqrt{\frac{b^2}{4} + \frac{a^3}{27}}}.$$

If p, q, r are real, and

if $\frac{b^2}{4} + \frac{a^3}{27} > 0,$ there are one real root and two conjugate imaginary roots,

if $\frac{b^2}{4} + \frac{a^3}{27} = 0,$ there are three real roots of which two are equal,

if $\frac{b^2}{4} + \frac{a^3}{27} < 0,$ there are three real and unequal roots.

If

$$\frac{b^2}{4} + \frac{a^3}{27} < 0,$$

the above formulas are impractical. The real roots are,

$$x_k = \mp 2\sqrt{-\frac{a}{3}}\cos\left(\frac{\phi}{3} + 120° K\right), \quad K = 0, 1, 2.$$

where

$$\cos\phi = \sqrt{\frac{b^2}{4} \div \left(-\frac{a^3}{27}\right)},$$

and where the upper signs are to be used if b is positive and the lower signs if b is negative.

If

$$\frac{b^2}{4} + \frac{a^3}{27} > 0,$$

the real root is,

$$x = \pm 2\sqrt{\frac{a}{3}}\operatorname{ctn} 2\phi,$$

where ϕ and ψ are to be computed from

$$\operatorname{ctn} 2\psi = \sqrt{\frac{b^2}{4} \div \frac{a^3}{27}}, \quad \tan \phi = \sqrt[3]{\tan \psi},$$

and where the upper sign is to be used if b is positive and the lower sign if b is negative.

If

$$\frac{b^2}{4} + \frac{a^3}{27} = 0,$$

the roots are,

$$x = \mp 2\sqrt{-\frac{a}{3}}, \quad \pm\sqrt{-\frac{a}{3}}, \quad \pm\sqrt{-\frac{a}{3}},$$

where the upper sign is to be used if b is positive, and the lower sign if b is negative.

29. Biquadratic (Quartic) Equation. The quartic equation

$$y^4 + py^3 + qy^2 + ry + s = 0$$

may be reduced to the form

$$x^4 + ax^2 + bx + c = 0$$

by the substitution

$$y = \left(x - \frac{p}{4}\right).$$

Let l, m, and n, denote the roots of the resolvent cubic

$$t^3 + \left(\frac{a}{2}\right)t^2 + \left(\frac{a^2 - 4c}{16}\right)t - \frac{b^2}{64} = 0.$$

The required roots of the reduced quartic are,

$$x_1 = \pm(-\sqrt{l} - \sqrt{m} - \sqrt{n}); \quad x_2 = \pm(-\sqrt{l} + \sqrt{m} + \sqrt{n});$$

$$x_3 = \pm(\sqrt{l} - \sqrt{m} + \sqrt{n}); \quad x_4 = \pm(\sqrt{l} + \sqrt{m} - \sqrt{n});$$

where the upper signs are to be used if b is positive, and the lower signs if b is negative.

30. General Equations of the nth degree.

$$P \equiv a_0x^n + a_1x^{n-1} + a_2x^{n-2} + \cdots + a_{n-1}x + a_n = 0.$$

If $n > 4$, there is no formula which gives the roots of this general equation. The following methods may be used to advantage:

(*a*) *Roots by factors.* By trial, find a number r such that $x = r$, satisfies the equation, that is, such that

$$a_0r^n + a_1r^{n-1} + a_2r^{n-2} + \cdots + a_{n-1}r + a_n = 0.$$

Then $(x-r)$ is a factor of the left hand member P of the equation. Divide P by $(x-r)$ leaving an equation of degree one less than that of the original equation. Next, proceed in the same manner with the reduced equation. (All integer roots of $P = 0$ are divisors of a_n.)

(*b*) *Roots by Approximation.* If for $x = a$ and $x = b$, the left member, P, of the equation has opposite signs, then a root lies between a and b. By repeated application of this principle, real roots to any desired degree of accuracy may be obtained.

(*c*) *Descartes' Rule.* The number of positive real roots of an equation with real coefficients is either equal to the number of its variations of sign or is less than that number by a positive even integer. A root of multiplicity m is here counted as m roots.

31. The Equation $x^n = a$. The n roots of this equation are:

$$x = \sqrt[n]{a}\left(\cos\frac{2k\pi}{n} + \sqrt{-1}\sin\frac{2k\pi}{n}\right), \text{ if } a > 0,$$

$$x = \sqrt[n]{-a}\left(\cos\frac{(2k+1)\pi}{n} + \sqrt{-1}\sin\frac{(2k+1)\pi}{n}\right), \text{ if } a < 0,$$

where k takes successively the values $0, 1, 2, 3, \cdots, n-1$.

31b. Stirling's Formula. For large values of n,

$$\sqrt{2n\pi}\,(n/e)^n < n! < \sqrt{2n\pi}\,(n/e)^n\,[1 + 1/(12n-1)],$$

where $\pi = 3.14159\cdots$, $e = 2.71828\cdots$.

$$\log n! \doteqdot (n + \tfrac{1}{2})\log n - n\log e + \log\sqrt{2\pi}.$$

II. ELEMENTARY GEOMETRY

Let a, b, c, d, and s denote lengths, A denote areas, and V denote volumes.

32. Triangle (see §65).

$A = bh/2$, where b denotes the base and h the altitude.

33. Rectangle.

$A = ab$, where a and b denote the lengths of the sides.

34. Parallelogram (opposite sides parallel).

$A = ah = ab \sin\theta$, where a and b denote the sides, h the altitude and θ the angle between the sides.

35. Trapezoid (four sides, two parallel).

$A = \frac{1}{2}h(a + b)$, where a and b are the sides and h the altitude.

36. Regular Polygon of n Sides (Fig. 1., See §37).

$$A = \frac{1}{4}n \cdot a^2 \operatorname{ctn} \frac{180^\circ}{n},$$ where a is length of side.

$$R = \frac{a}{2} \cdot \csc \frac{180^\circ}{n},$$ where R is radius of circumscribed circle.

$$r = \frac{a}{2} \cdot \operatorname{ctn} \frac{180^\circ}{n},$$ where r is radius of inscribed circle.

$$\alpha = \frac{360^\circ}{n} = \frac{2\pi}{n}$$ radians,

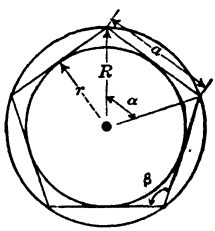

Fig. 1

$$\beta = \left(\frac{n-2}{n}\right) \cdot 180^\circ = \left(\frac{n-2}{n}\right)\pi$$ radians where α and β are the angles indicated in Fig. 1.

$$a = 2r \cdot \tan\frac{\alpha}{2} = 2R \cdot \sin\frac{\alpha}{2}.$$

37. Circle (Fig. 2).

Let C = circumference,
R = radius,
D = diameter,
A = area,
S = length of arc subtended by θ,
l = chord subtended by arc S,
h = rise,
θ = central angle in radians.

$C = 2\pi R = \pi D, \quad \pi = 3.14159 \cdots .$

$S = R\theta = \frac{1}{2}D\theta = D \cos^{-1} \frac{d}{R}.$

$l = 2\sqrt{R^2 - d^2} = 2R \sin \frac{\theta}{2} = 2d \tan \frac{\theta}{2}.$

$d = \frac{1}{2}\sqrt{4R^2 - l^2} = R \cos \frac{\theta}{2} = \frac{1}{2} l \operatorname{ctn} \frac{\theta}{2}.$

$h = R - d.$

$\theta = \frac{S}{R} = \frac{2S}{D} = 2 \cos^{-1} \frac{d}{R} = 2 \tan^{-1} \frac{l}{2d} = 2 \sin^{-1} \frac{l}{D}.$

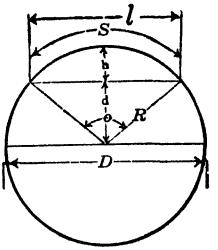

Fig. 2

A (circle) $= \pi R^2 = \frac{1}{4}\pi D^2.$

A (sector) $= \frac{1}{2} Rs = \frac{1}{2} R^2\theta.$

A (segment) $= A$ (sector) $- A$ (triangle) $= \frac{1}{2} R^2 (\theta - \sin \theta)$

$$= R^2 \cos^{-1} \frac{(R-h)}{R} - (R-h) \sqrt{2Rh - h^2}.$$

Perimeter of a n-side regular polygon inscribed in a circle

$$= 2n R \sin \frac{\pi}{n}.$$

Area of inscribed polygon $= \frac{1}{2} nR^2 \sin \frac{2\pi}{n}.$

Perimeter of a n-side regular polygon circumscribed about a circle

$$= 2nR \tan \frac{\pi}{n}.$$

Area of circumscribed polygon $= nR^2 \tan \frac{\pi}{n}.$

Radius of circle inscribed in a triangle of sides a, b, and c is

$$r = \sqrt{\frac{(s-a)(s-b)(s-c)}{s}}, \quad s = \tfrac{1}{2}(a+b+c).$$

Radius of circle circumscribed about a triangle is

$$R = \frac{abc}{4\sqrt{s(s-a)(s-b)(s-c)}}.$$

38. Ellipse (See §84).

$$\text{Perimeter} = \pi(a+b)\left[1+\frac{1}{4}\left(\frac{a-b}{a+b}\right)^2+\frac{1}{64}\left(\frac{a-b}{a+b}\right)^4+\cdots\right].$$

$A = \pi ab$, where a and b are lengths of semi-major and semi-minor axes respectively.

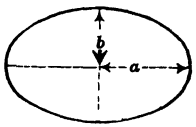

Fig. 3

39. Parabola (See §83).

$$A = 2ld/3.$$

$$\text{Height of } d_1 = \frac{d}{l^2}(l^2 - l_1^2).$$

$$\text{Width of } l_1 = l\sqrt{\frac{d-d_1}{d}}$$

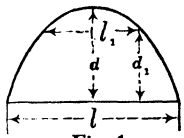

Fig. 4

$$\text{Length of arc} = l\left[1+\frac{2}{3}\left(\frac{2d}{l}\right)^2-\frac{2}{5}\left(\frac{2d}{l}\right)^4+\cdots\right].$$

40. Catenary, Cycloid, etc. (See §91 to §101).

41. Area by Approximation. If $y_0, y_1, y_2, \cdots, y_n$ be the lengths of a series of equally spaced parallel chords, and if h be their distant apart, the area enclosed by boundary is given approximately by any one of the following formulae:

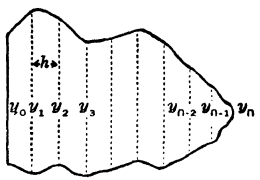

Fig. 5

$$A_T = h\left[\tfrac{1}{2}(y_0 + y_n) + y_1 + y_2 + \cdots + y_{n-1}\right]. \quad \text{(Trapezoidal Rule.)}$$

$$A_D = h\left[0.4(y_0 + y_n) + 1.1(y_1 + y_{n-1}) + y_2 + y_3 + \cdots + y_{n-2}\right]. \quad \text{(Durand's Rule.)}$$

$$A_S = \tfrac{1}{3}h\left[(y_0 + y_n) + 4(y_1 + y_3 + \cdots + y_{n-1}) + 2(y_2 + y_4 + \cdots + y_{n-2})\right]. \quad (n \text{ even, Simpson's Rule.})$$

In general, A_S gives the most accurate approximation.

The greater the value of n, the greater the accuracy of approximation.

42. Cube.

$V = a^3$; $d = a\sqrt{3}$; total surface area $= 6a^2$, where a is length of side and d is length of diagonal.

43. Rectangular Parallelopiped.

$V = abc$; $d = \sqrt{a^2 + b^2 + c^2}$; total surface area $= 2(ab + bc + ca)$, where a, b, and c are the lengths of the sides and d is length of diagonal.

44. Prism or Cylinder.

$V =$ (area of base) $\cdot$ (altitude).

Lateral area = (perimeter of right section) $\cdot$ (lateral edge).

45. Pyramid or Cone.

$V = \frac{1}{3}$ (area of base) $\cdot$ (altitude).

Lateral area of regular pyramid
$= \frac{1}{2}$ (perimeter of base) $\cdot$ (slant height).

46. Frustum of Pyramid or Cone.

$V = \frac{1}{3}(A_1 + A_2 + \sqrt{A_1 \cdot A_2})\ h$, where h is the altitude and A_1 and A_2 are the areas of the bases.

Lateral area of a regular figure
$= \frac{1}{2}$ (sum of perimeters of base) $\cdot$ (slant height).

47. Area of Surface and Volume of Regular Polyhedra of edge l.

Name	Type of Surface	Area of Surface	Volume
Tetrahedron	4 equilateral triangles	$1.73205l^2$	$0.11785l^3$
Hexahedron (cube)	6 squares	$6.00000l^2$	$1.00000l^3$
Octahedron	8 equilateral triangles	$3.46410l^2$	$0.47140l^3$
Dodecahedron	12 pentagons	$20.64578l^2$	$7.66312l^3$
Icosahedron	20 equilateral triangles	$8.66025l^2$	$2.18170l^3$

48. Sphere.

A (sphere) $= 4\pi R^2 = \pi D^2$.
A (zone) $= 2\pi Rh = \pi Dh$.
V (sphere) $= \frac{4}{3}\pi R^3 = \frac{1}{6}\pi D^3$.
V (spherical sector) $= \frac{2}{3}\pi R^2 h = \frac{1}{6}\pi D^2 h$.
V (spherical segment of one base) $= \frac{1}{6}\pi h_1 (3r_1^2 + h_1^2)$.
V (spherical segment of two bases) $= \frac{1}{6}\pi h(3r_1^2 + 3r_2^2 + h^2)$.
A (lune) $= 2R^2\theta$, where θ is angle in radians of lune.

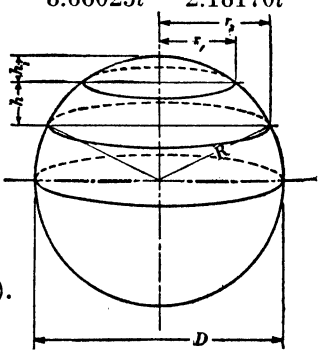

Fig. 6

49. Solid Angle (ψ). The solid angle (ψ) at any point P subtended by a surface S is equal to the area (A) of the portion of the surface of a sphere of unit radius, center at P, which is cut out by a conical surface, with vertex at P, passing through the perimeter of S.

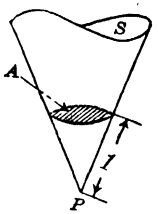

Fig. 7

The unit solid angle (ψ) is called the *steradian.*

The total solid angle about a point is 4π *steradians.*

50. Ellipsoid.

$V = \frac{4}{3}\pi abc$, where a, b, and c are the lengths of the semi-axes.

51. Torus.

$V = 2\pi^2 Rr^2$,

Area of surface $= (S) = 4\pi^2 Rr$.

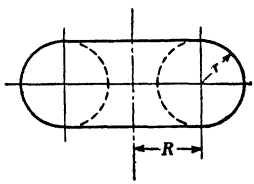

Fig. 8

III. TRIGONOMETRY

52. Angle. If two lines intersect, one line may be rotated about their point of intersection through the *angle* which they form until it coincides with the other line.

The angle is said to be *positive* if the rotation is counterclockwise, and *negative*, if clockwise.

A complete revolution of a line is a rotation through an angle of 360°. Thus,

A *degree* is 1/360 of the plane angle about a point.

A *radian* is the angle subtended at the center of a circle by an arc whose length is equal to that of the radius.

$$180° = \pi \text{ radians}; \quad 1° = \frac{\pi}{180} \text{ radians}; \quad 1 \text{ rad.} = \frac{180}{\pi} \text{ degrees.}$$

53. Trigonometric Functions of an Angle α.

Let α be any angle whose initial side lies on the positive x-axis and whose vertex is at the origin, and (x, y) be any point on the terminal side of the angle. (x is positive if measured along OX to the right, from the y-axis; and negative, if measured along OX' to the left from the y-axis. Likewise, y is positive if measured parallel to OY, and negative if measured parallel to OY'.) Let r be the positive distance from the origin to the point. The trigonometric functions of an angle are defined as follows:

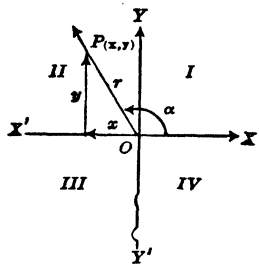

Fig. 9

sine α	=	sin α	=	$\frac{y}{r}$	.
cosine α	=	cos α	=	$\frac{x}{r}$	.
tangent α	=	tan α	=	$\frac{y}{x}$	.
cotangent α	=	ctn α = cot α	=	$\frac{x}{y}$	.
secant α	=	sec α	=	$\frac{r}{x}$	.
cosecant α	=	csc α	=	$\frac{r}{y}$	.
exsecant α	=	exsec α	=	sec α -1	.
versine α	=	vers α	=	$1 - \cos \alpha$	.
coversine α	=	covers α	=	$1 - \sin \alpha$	.
haversine α	=	hav α	=	$\frac{1}{2}$ vers α	.

54. Signs of the Functions.

Quadrant	sin	cos	tan	ctn	sec	csc
I	+	+	+	+	+	+
II	+	−	−	−	−	+

n denotes any integer.

For example: $\tan(270° + \alpha) = -\operatorname{ctn}\alpha$.

58. Fundamental Identities.

$$\sin\alpha = \frac{1}{\csc\alpha};\quad \cos\alpha = \frac{1}{\sec\alpha};\quad \tan\alpha = \frac{1}{\operatorname{ctn}\alpha} = \frac{\sin\alpha}{\cos\alpha}.$$

$$\csc\alpha = \frac{1}{\sin\alpha};\quad \sec\alpha = \frac{1}{\cos\alpha};\quad \operatorname{ctn}\alpha = \frac{1}{\tan\alpha} = \frac{\cos\alpha}{\sin\alpha}.$$

$$\sin^2\alpha + \cos^2\alpha = 1;\quad 1 + \tan^2\alpha = \sec^2\alpha;\quad 1 + \operatorname{ctn}^2\alpha = \csc^2\alpha.$$

$$\sin 2\alpha = 2\sin\alpha\cos\alpha,$$

$$\cos 2\alpha = 2\cos^2\alpha - 1 = 1 - 2\sin^2\alpha = \cos^2\alpha - \sin^2\alpha,$$

$$\tan 2\alpha = \frac{2\tan\alpha}{1 - \tan^2\alpha},$$

$$\sin 3\alpha = 3\sin\alpha - 4\sin^3\alpha,$$

$$\cos 3\alpha = 4\cos^3\alpha - 3\cos\alpha,$$

$$\sin n\alpha = 2\sin(n-1)\alpha\cdot\cos\alpha - \sin(n-2)\alpha,$$

$$\cos n\alpha = 2\cos(n-1)\alpha\cdot\cos\alpha - \cos(n-2)\alpha,$$

$$\sin(\alpha \pm \beta) = \sin\alpha\cos\beta \pm \cos\alpha\sin\beta,$$

$$\cos(\alpha \pm \beta) = \cos\alpha\cos\beta \mp \sin\alpha\sin\beta,$$

$$\tan(\alpha \pm \beta) = \frac{\tan\alpha \pm \tan\beta}{1 \mp \tan\alpha\tan\beta}.$$

$$\sin\alpha + \sin\beta = 2\sin\tfrac{1}{2}(\alpha+\beta)\cdot\cos\tfrac{1}{2}(\alpha-\beta),$$

$$\sin\alpha - \sin\beta = 2\cos\tfrac{1}{2}(\alpha+\beta)\cdot\sin\tfrac{1}{2}(\alpha-\beta),$$

$$\cos\alpha + \cos\beta = 2\cos\tfrac{1}{2}(\alpha+\beta)\cdot\cos\tfrac{1}{2}(\alpha-\beta),$$

$$\cos\alpha - \cos\beta = -2\sin\tfrac{1}{2}(\alpha+\beta)\cdot\sin\tfrac{1}{2}(\alpha-\beta).$$

$$\sin\frac{\alpha}{2} = \pm\sqrt{\frac{1-\cos\alpha}{2}},$$ positive if $\frac{\alpha}{2}$ in I or II quadrants, negative otherwise.

$$\cos\frac{\alpha}{2} = \pm\sqrt{\frac{1+\cos\alpha}{2}},$$ positive if $\frac{\alpha}{2}$ in I or IV, negative otherwise.

$$\tan\frac{\alpha}{2} = \frac{1-\cos\alpha}{\sin\alpha} = \frac{\sin\alpha}{1+\cos\alpha} = \pm\sqrt{\frac{1-\cos\alpha}{1+\cos\alpha}},$$ positive if $\frac{\alpha}{2}$ in I or III, negative otherwise.

$$\sin^2\alpha = \tfrac{1}{2}(1 - \cos 2\alpha);\qquad \cos^2\alpha = \tfrac{1}{2}(1 + \cos 2\alpha).$$

$$\sin^3\alpha = \tfrac{1}{4}(3\sin\alpha - \sin 3\alpha);\quad \cos^3\alpha = \tfrac{1}{4}(\cos 3\alpha + 3\cos\alpha).$$

$$\sin\alpha\sin\beta = \tfrac{1}{2}\cos(\alpha-\beta) - \tfrac{1}{2}\cos(\alpha+\beta),$$

$$\cos\alpha\cos\beta = \tfrac{1}{2}\cos(\alpha-\beta) + \tfrac{1}{2}\cos(\alpha+\beta),$$

$$\sin\alpha\cos\beta = \tfrac{1}{2}\sin(\alpha+\beta) + \tfrac{1}{2}\sin(\alpha-\beta).$$

59. Equivalent Expressions for sin α, cos α, tan α, etc.

Function	Sin α	Cos α	Tan α	Ctn α	Sec α	Csc α
Sin α	Sin α	$\pm\sqrt{1-\cos^2\alpha}$	$\dfrac{\tan\alpha}{\pm\sqrt{1+\tan^2\alpha}}$	$\dfrac{1}{\pm\sqrt{1+\operatorname{ctn}^2\alpha}}$	$\dfrac{\pm\sqrt{\sec^2\alpha-1}}{\sec\alpha}$	$\dfrac{1}{\csc\alpha}$
Cos α	$\pm\sqrt{1-\sin^2\alpha}$	cos α	$\dfrac{1}{\pm\sqrt{1+\tan^2\alpha}}$	$\dfrac{\operatorname{ctn}\alpha}{\pm\sqrt{1+\operatorname{ctn}^2\alpha}}$	$\dfrac{1}{\sec\alpha}$	$\dfrac{\pm\sqrt{\csc^2\alpha-1}}{\csc\alpha}$
Tan α	$\dfrac{\sin\alpha}{\pm\sqrt{1-\sin^2\alpha}}$	$\dfrac{\pm\sqrt{1-\cos^2\alpha}}{\cos\alpha}$	tan α	$\dfrac{1}{\operatorname{ctn}\alpha}$	$\pm\sqrt{\sec^2\alpha-1}$	$\dfrac{1}{\pm\sqrt{\csc^2\alpha-1}}$

Note: The quadrant in which α terminates determines the sign to be used. See previous table of signs.

60. Inverse or Anti-trigonometric Functions. The complete solution of the equation $x = \sin y$ is

$$y = (-1)^n \sin^{-1} x + n(180°), \quad -\pi/2 \leqq \sin^{-1} x \leqq \pi/2,$$

where $\sin^{-1} x$ is the principal value of the angle whose sine is x.

Likewise, if $x = \cos y$,

$$y = \pm \cos^{-1} x + n(360°), \quad 0 \leqq \cos^{-1} x \leqq \pi.$$

If $x = \tan y$,

$$y = \tan^{-1} x + n(180°), \quad -\pi/2 \leqq \tan^{-1} x \leqq \pi/2.$$

Similar relations hold for $x = \operatorname{ctn} y$, $x = \sec y$, $x = \csc y$.

61. Certain Relations Among Inverse Functions. If the inverse functions are restricted as in §60, the following formulae hold:

$$\sin^{-1} a = \cos^{-1}\sqrt{1-a^2} = \tan^{-1}\frac{a}{\sqrt{1-a^2}} = \operatorname{ctn}^{-1}\frac{\sqrt{1-a^2}}{a}$$

$$= \sec^{-1}\frac{1}{\sqrt{1-a^2}} = \csc^{-1}\frac{1}{a}.$$

$$\cos^{-1} a = \sin^{-1}\sqrt{1-a^2} = \tan^{-1}\frac{\sqrt{1-a^2}}{a} = \operatorname{ctn}^{-1}\frac{a}{\sqrt{1-a^2}}$$

$$= \sec^{-1}\frac{1}{a} = \csc^{-1}\frac{1}{\sqrt{1-a^2}}.$$

$$\tan^{-1} a = \sin^{-1}\frac{a}{\sqrt{1+a^2}} = \cos^{-1}\frac{1}{\sqrt{1+a^2}} = \operatorname{ctn}^{-1}\frac{1}{a}$$

$$= \sec^{-1}\sqrt{1+a^2} = \csc^{-1}\frac{\sqrt{1+a^2}}{a}.$$

$$\operatorname{ctn}^{-1} a = \tan^{-1}\frac{1}{a}; \quad \sec^{-1} a = \cos^{-1}\frac{1}{a}; \quad \csc^{-1} a = \sin^{-1}\frac{1}{a}.$$

62. Solution of Trigonometric Equations. To solve a trigonometric equation, reduce the given equation, by means of the relations expressed in §58 to §60 inclusive, to an equation containing only a single function of a single angle. Solve the resulting equation by algebraic methods (§30) for the remaining function, and from this find the values of the angle, by §57 and Table V. All these values should then be tested in the original equation, discarding those which do not satisfy it.

63. Relations Between Sides and Angles of Plane Triangles. Let a, b, c, denote the sides and α, β, γ, the corresponding opposite angles with

$2s = a + b + c$; r = radius of inscribed circle;

A = area; R = radius of circumscribed circle;

h_b = altitude on side b.

$\alpha + \beta + \gamma = 180°$.

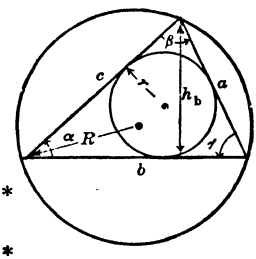

Fig. 10

$$\frac{a}{\sin\alpha} = \frac{b}{\sin\beta} = \frac{c}{\sin\gamma}. \quad \text{(Law of Sines).}$$

$$\frac{a+b}{a-b} = \frac{\tan\frac{1}{2}(\alpha+\beta)}{\tan\frac{1}{2}(\alpha-\beta)}. \quad \text{(Law of Tangents).*}$$

$$a^2 = b^2 + c^2 - 2bc\cos\alpha. \quad \text{(Law of Cosines).*}$$

$$a = b\cos\gamma + c\cos\beta.*$$

$$\cos\alpha = \frac{b^2+c^2-a^2}{2bc},* \quad \sin\alpha = \frac{2}{bc}\sqrt{s(s-a)(s-b)(s-c)}.*$$

$$\sin\frac{\alpha}{2} = \sqrt{\frac{(s-b)(s-c)}{bc}}, \quad *\cos\frac{\alpha}{2} = \sqrt{\frac{s(s-a)}{bc}};*$$

$$\tan\frac{\alpha}{2} = \sqrt{\frac{(s-b)(s-c)}{s(s-a)}} = \frac{r}{s-a},* \text{ where } r = \sqrt{\frac{(s-a)(s-b)(s-c)}{s}}.*$$

$$A = \tfrac{1}{2}bh_b* = \tfrac{1}{2}ab\sin\gamma* = \frac{a^2\sin\beta\sin\gamma}{2\sin\alpha}*$$

$$= \sqrt{s(s-a)(s-b)(s-c)} = rs.$$

$$R = \frac{a}{2\sin\alpha}* = \frac{abc}{4A}. \qquad h_b = c\sin\alpha* = a\sin\gamma* = \frac{2rs}{b}$$

*Two more formulas may be obtained by replacing a by b, b by c, c by a, α by β, β by γ, γ by α.

64. Solution of a Right Triangle. Given one side and any acute angle α, or any two sides, to find the remaining parts.

$$a = \sqrt{(c+b)(c-b)} = c\sin\alpha = b\tan\alpha.$$

$$b = \sqrt{(c+a)(c-a)} = c\cos\alpha = \frac{a}{\tan\alpha}.$$

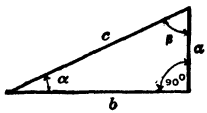

Fig. 11

$$\sin\alpha = \frac{a}{c},\quad \cos\alpha = \frac{b}{c},\quad \tan\alpha = \frac{a}{b},\quad \beta = 90° - \alpha.$$

$$c = \frac{a}{\sin\alpha} = \frac{b}{\cos\alpha} = \sqrt{a^2+b^2}.$$

$$A = \tfrac{1}{2}ab = \frac{a^2}{2\tan\alpha} = \frac{b^2\tan\alpha}{2} = \frac{c^2\sin 2\alpha}{4}.$$

65. Solution of Oblique Triangles (Fig. 12). The formulas of the preceding section §63 will suffice to solve any oblique triangle. Use the trigonometric tables for numerical work. We give one method. Solutions should be checked by some other method.

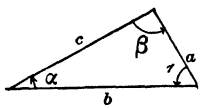

Fig. 12

(*a*) Given any two sides b and c and included angle α.

$$\tfrac{1}{2}(\beta+\gamma) = 90° - \tfrac{1}{2}\alpha;\quad \tan\tfrac{1}{2}(\beta-\gamma) = \frac{b-c}{b+c}\tan\tfrac{1}{2}(\beta+\gamma);$$

$$\beta = \tfrac{1}{2}(\beta+\gamma) + \tfrac{1}{2}(\beta-\gamma);\quad \gamma = \tfrac{1}{2}(\beta+\gamma) - \tfrac{1}{2}(\beta-\gamma);\quad a = \frac{b\sin\alpha}{\sin\beta}.$$

(*b*) Given any two angles α and β, and any side c.

$$\gamma = 180° - (\alpha+\beta);\quad a = \frac{c\sin\alpha}{\sin\gamma};\quad b = \frac{c\sin\beta}{\sin\gamma}.$$

(*c*) Given any two sides a and c, and an angle opposite one of these, say α.

$$\sin\gamma = \frac{c\sin\alpha}{a},\quad \beta = 180° - (\alpha+\gamma),\quad b = \frac{a\sin\beta}{\sin\alpha}.$$

This case may have two sets of solutions, for γ may have two values, $\gamma_1 < 90°$ and $\gamma_2 = 180° - \gamma_1 > 90°$. If $\alpha + \gamma_2 > 180°$, use only γ_1.

(*d*) Given the three sides a, b, and c.

$$s = \tfrac{1}{2}(a+b+c),\quad r = \sqrt{\frac{(s-a)(s-b)(s-c)}{s}}.$$

$$\tan\tfrac{1}{2}\alpha = \frac{r}{s-a},\quad \tan\tfrac{1}{2}\beta = \frac{r}{s-b},\quad \tan\tfrac{1}{2}\gamma = \frac{r}{s-c}$$

Spherical Trigonometry

66. The Right Spherical Triangle. Let O be the center of sphere and a, b, c the sides of a right triangle with opposite angles $\alpha, \beta,$ and $\gamma = 90°$, respectively, the sides being measured by the angle subtended at the center of the sphere.

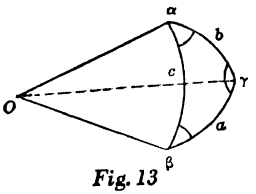

Fig. 13

$$\sin a = \sin \alpha \cdot \sin c, \qquad \sin b = \sin \beta \cdot \sin c.$$
$$\sin a = \tan b \cdot \operatorname{ctn} \beta, \qquad \sin b = \tan a \cdot \operatorname{ctn} \alpha.$$
$$\cos \alpha = \cos a \cdot \sin \beta, \qquad \cos \beta = \cos b \cdot \sin \alpha.$$
$$\cos \alpha = \tan b \cdot \operatorname{ctn} c, \qquad \cos \beta = \tan a \cdot \operatorname{ctn} c.$$
$$\cos c = \operatorname{ctn} \alpha \cdot \operatorname{ctn} \beta, \qquad \cos c = \cos a \cdot \cos b.$$

67. Napier's Rules of Circular Parts (See Fig. 14). Let the five quantities a, b, co–α (complement of α), co–c, co–β, be arranged in order as indicated in the figure. If we denote any one of these quantities a *middle* part, then two of the other parts are *adjacent* to it, and the other two parts are *opposite* to it. The above formulas may be remembered by means of the following rules:

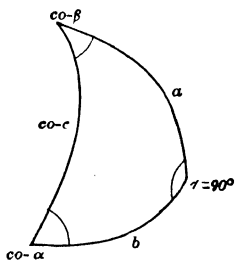

Fig. 14

(*a*) *The sine of a middle part is equal to the product of the tangents of the adjacent parts.*

(*b*) *The sine of a middle part is equal to the product of the cosines of the opposite parts.*

68. The Oblique Spherical Triangle. Let a, b, c denote the sides and α, β, γ the corresponding opposite angles of the spherical triangle, Δ its area, E its spherical excess, R the radius of the sphere upon which the triangle lies, and α', β', γ', a, b, c the corresponding parts of the polar triangle.

$$0° < a + b + c < 360°, \qquad 180° < \alpha + \beta + \gamma < 540°.$$
$$\alpha = 180° - a', \qquad \beta = 180° - b', \qquad \gamma = 180° - c',$$
$$a = 180° - \alpha', \qquad b = 180° - \beta', \qquad c = 180° - \gamma'.$$

$$\frac{\sin\alpha}{\sin a} = \frac{\sin\beta}{\sin b} = \frac{\sin\gamma}{\sin c}. \quad \text{(Law of Sines).}$$

$$\cos a = \cos b \cdot \cos c + \sin b \cdot \sin c \cdot \cos\alpha.$$
$$\cos\alpha = -\cos\beta \cdot \cos\gamma + \sin\beta \cdot \sin\gamma \cdot \cos a. \quad \text{(Law of Cosines)}$$

$$\tan\frac{\alpha}{2} = \sqrt{\frac{\sin(s-b)\cdot\sin(s-c)}{\sin s\cdot\sin(s-a)}}, \text{ where } s = \tfrac{1}{2}(a+b+c).$$

$$\tan\frac{a}{2} = \sqrt{\frac{-\cos\sigma\cdot\cos(\sigma-\alpha)}{\cos(\sigma-\beta)\cdot\cos(\sigma-\gamma)}}, \text{ where } \sigma = \tfrac{1}{2}(\alpha+\beta+\gamma).$$

$$\frac{\sin\frac{1}{2}(\alpha+\beta)}{\sin\frac{1}{2}(\alpha-\beta)} = \frac{\tan\frac{1}{2}c}{\tan\frac{1}{2}(a-b)}, \quad \frac{\cos\frac{1}{2}(\alpha+\beta)}{\cos\frac{1}{2}(\alpha-\beta)}, = \frac{\tan\frac{1}{2}c}{\tan\frac{1}{2}(a+b)}.$$

$$\frac{\sin\frac{1}{2}(a+b)}{\sin\frac{1}{2}(a-b)} = \frac{\operatorname{ctn}\frac{1}{2}\gamma}{\tan\frac{1}{2}(\alpha-\beta)}, \quad \frac{\cos\frac{1}{2}(a+b)}{\cos\frac{1}{2}(a-b)}, = \frac{\operatorname{ctn}\frac{1}{2}\gamma}{\tan\frac{1}{2}(\alpha+\beta)}.$$

$$\tan\frac{E}{4} = \sqrt{\tan\tfrac{1}{2}s\cdot\tan\tfrac{1}{2}(s-a)\cdot\tan\tfrac{1}{2}(s-b)\cdot\tan\tfrac{1}{2}(s-c)}$$

$$\Delta = \frac{\pi R^2 \cdot E}{180} \qquad \alpha+\beta+\gamma - 180° = E.$$

*Hyperbolic Functions**

69. Definitions (For definition of e see §108).

Hyperbolic sine of x $= \sinh x = \frac{1}{2}(e^x - e^{-x})$;

Hyperbolic cosine of x $= \cosh x = \frac{1}{2}(e^x + e^{-x})$;

Hyperbolic tangent of $x = \tanh x = \dfrac{e^x - e^{-x}}{e^x + e^{-x}}$;

$$\operatorname{csch} x = \frac{1}{\sinh x}; \qquad \operatorname{sech} x = \frac{1}{\cosh x}; \qquad \operatorname{ctnh} x = \frac{1}{\tanh x}.$$

*For derivatives and integrals of Hyperbolic functions see §108 and §121.

70. Inverse or Anti-Hyperbolic Functions (See §60).

If $x = \sinh y$, then y is the *inverse hyperbolic sine* of x, written $y = \sinh^{-1} x$ or arc sinh x.

$$\sinh^{-1} x = \log_e(x + \sqrt{x^2 + 1}), \quad \cosh^{-1} x = \log_e(x + \sqrt{x^2 - 1}),$$

$$\tanh^{-1} x = \tfrac{1}{2} \log_e \left(\frac{1 + x}{1 - x}\right), \quad \operatorname{ctnh}^{-1} x = \tfrac{1}{2} \log_e \left(\frac{x + 1}{x - 1}\right),$$

$$\operatorname{sech}^{-1} x = \log_e \left(\frac{1 + \sqrt{1 - x^2}}{x}\right), \quad \operatorname{csch}^{-1} x = \log_e \left(\frac{1 + \sqrt{1 + x^2}}{x}\right).$$

71. Certain Relations among Hyperbolic Functions.

$$\sinh(-x) = -\sinh x, \qquad \cosh^2 x - \sinh^2 x = 1,$$
$$\cosh(-x) = \cosh x, \qquad \operatorname{sech}^2 x + \tanh^2 x = 1,$$
$$\tanh(-x) = -\tanh x, \qquad \operatorname{csch}^2 x - \operatorname{ctnh}^2 x = -1.$$

$$\tanh(x) = \frac{\sinh x}{\cosh x}$$

$$\sinh(x \pm y) = \sinh x \cosh y \pm \cosh x \sinh y.$$
$$\cosh(x \pm y) = \cosh x \cosh y \pm \sinh x \sinh y.$$
$$\sinh 2x = 2 \sinh x \cdot \cosh x, \qquad \cosh 2x = \cosh^2 x + \sinh^2 x.$$

$$2 \sinh^2 \frac{x}{2} = \cosh x - 1, \qquad 2 \cosh^2 \frac{x}{2} = \cosh x + 1.$$

72. Hyperbolic Functions of Complex Quantities, Connection with Circular Functions.

$$\sin x = -\tfrac{1}{2} i (e^{ix} - e^{-ix}) = -i \sinh ix, \quad i^2 = -1.$$
$$\cos x = \tfrac{1}{2} (e^{ix} + e^{-ix}) = \cosh ix.$$
$$\sinh iy = i \sin y, \quad \cosh iy = \cos y, \quad \tanh iy = i \tan y.$$
$$\sinh(x \pm iy) = \sinh x \cdot \cos y \pm i \cosh x \sin y.$$
$$\cosh(x \pm iy) = \cosh x \cdot \cos y \pm i \sinh x \cdot \sin y.$$
$$\sinh(x + 2i\pi) = \sinh x, \qquad \cosh(x + 2i\pi) = \cosh x.$$
$$\sinh(x + i\pi) = -\sinh x, \qquad \cosh(x + i\pi) = -\cosh x.$$
$$\sinh(x + \tfrac{1}{2} i\pi) = i \cosh x, \qquad \cosh(x + \tfrac{1}{2} i\pi) = i \sinh x.$$

$$\log_e(x \pm iy) = \tfrac{1}{2} \log_e(x^2 + y^2) \pm i \arctan \frac{y}{x}.$$

IV. ANALYTIC GEOMETRY

73. Rectangular Coördinates. Let $X'X$ (x–axis) and $Y'Y$ (y–axis) be two perpendicular lines meeting in the point O called the origin. The point P (x, y) in the plane of the x and y axes is fixed by the distances x (abscissa) and y (ordinate) from $Y'Y$ and $X'X$, respectively, to P. x is positive to the right and negative to the left of the y–axis, and y is positive above and negative below the x–axis.

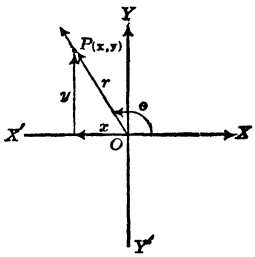

Fig. 15

74. Polar Coördinates. Let OX (initial line) be a fixed line in the plane and O (pole or origin) a point on this line. The position of any point P (r, θ) in the plane is determined by the distance r (radius vector) from O to the point together with the angle (vectorial angle) measured from OX to OP. θ is positive if measured counter-clockwise, negative if measured clockwise, r is positive if measured along the terminal side of θ and negative if measured along the terminal side of θ produced through the pole.

75. Relations between Rectangular and Polar Coördinates (See §113).

$$\begin{cases} x = r\cos\theta, \\ y = r\sin\theta, \end{cases} \qquad \begin{cases} r = \sqrt{x^2 + y^2}, \\ \theta = \tan^{-1}\dfrac{y}{x}, \end{cases} \qquad \begin{cases} \sin\theta = \dfrac{y}{\sqrt{x^2 + y^2}}, \\ \cos\theta = \dfrac{x}{\sqrt{x^2 + y^2}}, \end{cases}$$

76. Points and Slopes.

Let $P_1(x_1, y_1)$ and $P_2(x_2, y_2)$ be any two points, and α_1 be the angle measured counter-clockwise from OX to P_1P_2:

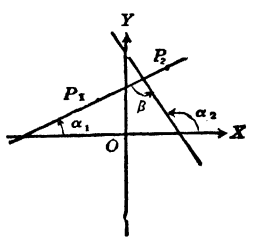

Fig. 16

Distance between P_1 and $P_2 = P_1P_2$

$$= d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}.$$

Slope of $P_1P_2 = \tan\alpha_1 = m = \dfrac{y_2 - y_1}{x_2 - x_1}.$

Point dividing P_1P_2 in the ratio $m_1 : m_2$ is $\left(\frac{m_1x_2+m_2x_1}{m_1+m_2}, \frac{m_1y_2+m_2y_1}{m_1+m_2}\right)$.

Mid-point of P_1P_2 is $\left(\frac{x_1+x_2}{2}, \frac{y_1+y_2}{2}\right)$.

The angle β between lines of slopes m_1 and m_2, respectively, is given by $$\tan\beta = \frac{m_2 - m_1}{1 + m_1m_2}.$$

Two lines of slopes m_1 and m_2 are perpendicular if $m_2 = -\frac{1}{m_1}$, and parallel if $m_1 = m_2$.

77. Area of Triangle. If the vertices are the points (x_1, y_1), (x_2, y_2), (x_3, y_3), then the area is equal to the numerical value of

$$\frac{1}{2}\begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix} = \tfrac{1}{2}(x_1y_2 - x_1y_3 + x_2y_3 - x_2y_1 + x_3y_1 - x_3y_2).$$

78. Locus and Equation. The set of all points which satisfy a given condition is called the *locus* of that condition. An *equation* is called the equation of the locus if it is satisfied by the coördinates of every point on the locus and by no other points. There are three common representations of the locus by means of equations:

(*a*) *Rectangular equation* which involves the rectangular coördinates (x, y).

(*b*) *Polar equation* which involves the polar coördinates (r, θ).

(*c*) *Parametric equations* which expresses x and y or r and θ in terms of a third independent variable called a parameter.

79. Transformation of Coördinates. To transform an equation or a curve from one system of coördinates in x, y, to another such system in x', y', substitute for each variable its value in terms of variables of the new system.

(*a*) *Rectangular System. Old axes parallel to new axes.*

The coördinates of new origin in terms of old system are (h, k).

$$\begin{cases} x = x' + h, \\ y = y' + k. \end{cases}$$

(*b*) *Rectangular System. Old origin coincident with new origin and the x'-axis making an angle θ with the x-axis.*

$$\begin{cases} x = x' \cdot \cos\theta - y' \cdot \sin\theta, \\ y = x' \cdot \sin\theta + y' \cdot \cos\theta. \end{cases}$$

(*c*) *Rectangular System. Old axes not parallel with new. New origin at (h, k) in old system.*

$$\begin{cases} x = x' \cdot \cos\theta - y' \cdot \sin\theta + h, \\ y = x' \cdot \sin\theta + y' \cdot \cos\theta + k. \end{cases}$$

80. Straight Line. The equations of the straight line may assume the following forms:

(*a*) $y = mx + b$. (m = slope, b = intercept on y-axis.)

(*b*) $y - y_1 = m(x - x_1)$. [m = slope, line passes through point (x_1, y_1).]

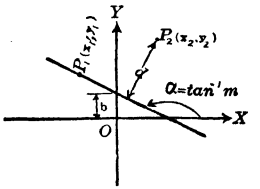

Fig. 17

(*c*) $\dfrac{y - y_1}{x - x_1} = \dfrac{y_2 - y_1}{x_2 - x_1}$. [line passes thru points (x_1, y_1) and (x_2, y_2).]

(*d*) $\dfrac{x}{a} + \dfrac{y}{b} = 1$. (a and b are the intercepts on x and y-axes, respectively.)

(*e*) $x\cos\alpha + y\sin\alpha = p$. (normal form. p is distance from origin to the line, α is angle which normal to the line makes with x-axis.)

(*f*) $Ax + By + C = 0$. (general form. slope $= -A \div B$).

To reduce $Ax + By + C = 0$ to normal form (*e*), divide by $\pm\sqrt{A^2 + B^2}$, where the sign of the radical is taken opposite to that of C when $C \neq 0$.

The distance from the line $Ax + By + C = 0$ to the point $P_2(x_2, y_2)$ is:

$$d = \frac{Ax_2 + By_2 + C}{\pm\sqrt{A^2 + B^2}}.$$

81. Circle (See §37). General equation of circle with radius R and center at (h, k) is:

$$(x - h)^2 + (y - k)^2 = R^2.$$

82. Conic. The locus of a point (P) which moves so that its distance from a fixed point (focus) bears a constant ratio e (eccentricity) to its distance from a fixed straight line (directrix) is a conic.

If d is the distance from focus to directrix,

$x^2 + y^2 = e^2 (d + x)^2$.

$r = \dfrac{de}{1 - e \cos \theta}$.

If $e = 1$, the conic is a *parabola*; if $e > 1$, a *hyperbola*; and if $e < 1$, an *ellipse*.

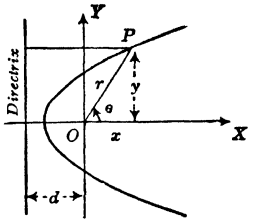

Fig. 18

83. Parabola (See §39). $e = 1$.

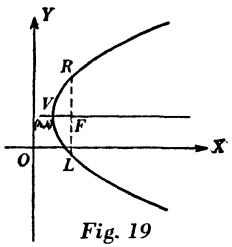

Fig. 19

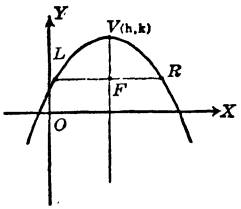

Fig. 20

(*a*) $(y - k)^2 = 4a(x - h)$. Vertex at (h, k), axis $\| OX$. (*Fig.* 19.)

(*b*) $(x - h)^2 = 4a(y - k)$. Vertex at (h, k), axis $\| OY$. (*Fig.* 20.)

Distance from vertex to focus $= VF = a$.

Latus rectum $= LR = 4a$.

84. Ellipse (See §38). $e < 1$.

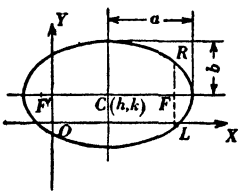

Fig. 21

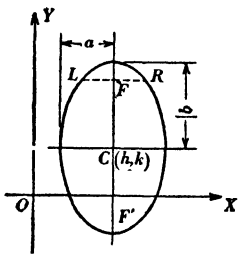

Fig. 22

$\dfrac{(x - h)^2}{a^2} + \dfrac{(y - k)^2}{b^2} = 1$. Center at (h, k), axes $\| OX, OY$.

	$a>b$, (*Fig.* 21)	$a<b$, (*Fig.* 22)
Major axis	$2a$	$2b$
Minor axis	$2b$	$2a$
Distance from center to either focus	$\sqrt{a^2-b^2}$	$\sqrt{b^2-a^2}$
Eccentricity, e	$\frac{\sqrt{a^2-b^2}}{a}$	$\frac{\sqrt{b^2-a^2}}{b}$
Latus rectum	$\frac{2b^2}{a}$	$\frac{2a^2}{b}$
Sum of distances from any point P on ellipse to the foci, $PF'+PF$	$2a$	$2b$

85. Hyperbola. $e > 1$.

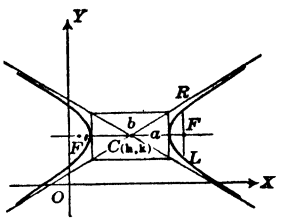

Fig. 23

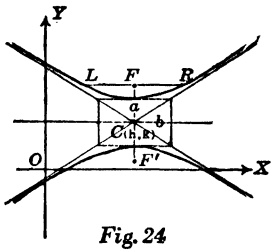

Fig. 24

(*a*) $\frac{(x-h)^2}{a^2} - \frac{(y-k)^2}{b^2} = 1$. Center at (h,k), transverse axis $\| OX$.
Slopes of asymptotes $= \pm b/a$. (Fig. 23.)

(*b*) $\frac{(y-k)^2}{a^2} - \frac{(x-h)^2}{b^2} = 1$. Center at (h,k), transverse axis $\| OY$.
Slopes of asymptotes $= \pm a/b$. (Fig. 24.)

Transverse axis $= 2a$. Conjugate axis $= 2b$.
Distance from center to either focus $= \sqrt{a^2+b^2}$.
Difference of distances of any point on hyperbola from the foci $= 2a$.

Eccentricity $= e = \frac{\sqrt{a^2+b^2}}{a}$.

Latus Rectum $= 2b^2/a$.

86. Sine Wave.

$y = a \sin(bx + c)$.

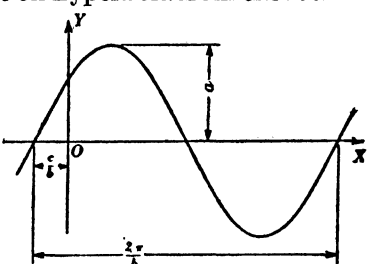

Fig. 25

$y = a \cos (bx + c') = a \sin (bx + c)$, where $c = c' + \frac{\pi}{2}$.

$y = p \sin bx + q \cos bx = a \sin (bx + c)$,

where $c = \tan^{-1}\left(\frac{q}{p}\right)$, $a = \sqrt{p^2 + q^2}$.

a = amplitude = maximum height of wave.

$\frac{2\pi}{b}$ = wave length = distance from any point on wave to the corresponding point on the next wave.

$x = -\frac{c}{b}$ = phase, indicates a point on x-axis from which the positive half of the wave starts.

87. Trigonometric Curves.

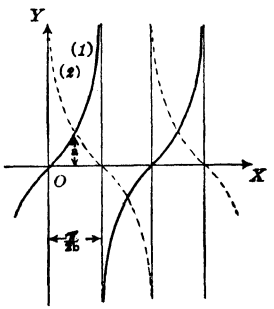

Fig. 26

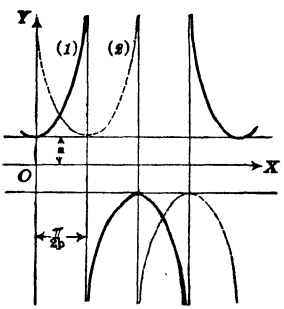

Fig. 27

(1) $y = a \tan bx$ or $x = \frac{1}{b} \tan^{-1}\left(\frac{y}{a}\right)$. (1) $y = a \sec bx$ or $x = \frac{1}{b} \sec^{-1}\left(\frac{y}{a}\right)$.

(2) $y = a \operatorname{ctn} bx$ or $x = \frac{1}{b} \operatorname{ctn}^{-1}\left(\frac{y}{a}\right)$. (2) $y = a \csc bx$ or $x = \frac{1}{b} \csc^{-1}\left(\frac{y}{a}\right)$.

88. Logarithmic and Exponential Curves.

Logarithmic Curve

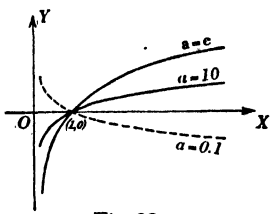

Fig. 28

$y = \log_a x$ or $x = a^y$.

Exponential Curve

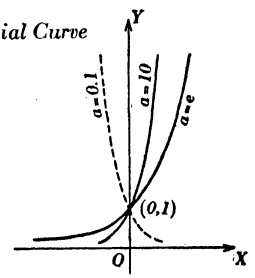

Fig. 29

$y = a^x$ or $x = \log_a y$.

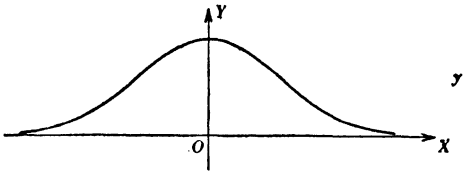

Fig. 30

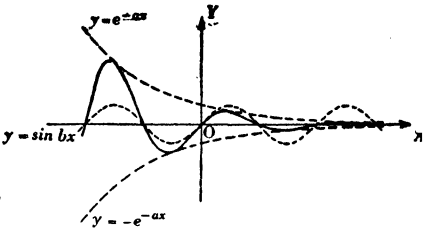

Fig. 31

89. Probability Curve (Fig. 30). $y = e^{-x^2}$

90. Oscillatory Wave of Decreasing Amplitude (Fig. 31).

$$y = e^{-ax} \sin bx.$$

91. Catenary (Fig. 32).

$$y = \frac{a}{2}\left(e^{\frac{x}{a}} + e^{-\frac{x}{a}}\right).$$

A curve made by a cord of uniform weight suspended freely between two points. (See §69.)

Length of arc $= s = l\left[1 + \frac{2}{3}\left(\frac{2d}{l}\right)^2\right]$

approximately, if d is small in comparison with l.

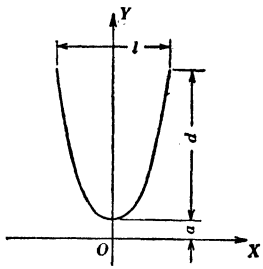

Fig. 32

92. Cycloid (Fig. 33). $\begin{cases} x = a(\phi - \sin\phi). \\ y = a(1 - \cos\phi). \end{cases}$

A curve described by a point on the circumference of circle which rolls along a fixed straight line.

Area one arch $= 3\pi a^2$.

Length of arc of one arch $= 8a$.

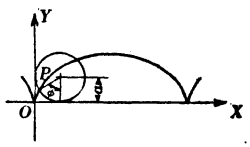

Fig. 33

93. Prolate and Curtate Cycloid. $\begin{cases} x = a\phi - b\sin\phi, \\ y = a - b\cos\phi. \end{cases}$

A curve described by a point on a circle at a distance b from the center of the circle of radius a which rolls along a fixed straight line.

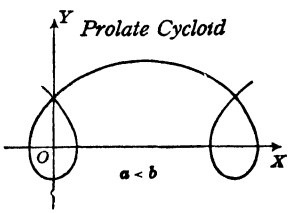

Fig. 34

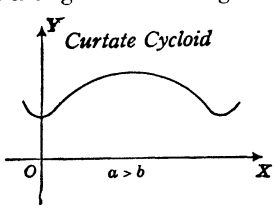

Fig. 35

94. Epicycloid (Fig. 36).

$$\begin{cases} x = (a+b)\cos\phi - a\cos\left(\dfrac{a+b}{a}\phi\right), \\ y = (a+b)\sin\phi - a\sin\left(\dfrac{a+b}{a}\phi\right). \end{cases}$$

A curve described by a point on the circumference of a circle which rolls along the outside of a fixed circle.

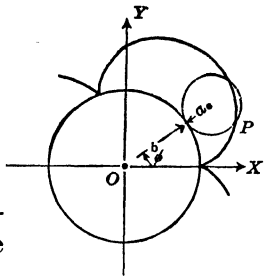

Fig. 36

95. Cardioid (Fig. 37).

$$r = a(1 + \cos\theta).$$

An epicycloid in which both circles have same radii is called a cardioid.

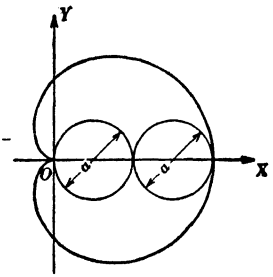

Fig. 37

96. Hypocycloid.

$$\begin{cases} x = (a-b)\cos\phi + b\cos\left(\dfrac{a-b}{b}\phi\right), \\ y = (a-b)\sin\phi - b\sin\left(\dfrac{a-b}{b}\phi\right). \end{cases}$$

A curve described by a point on the circumference of a circle which rolls along the inside of a fixed circle.

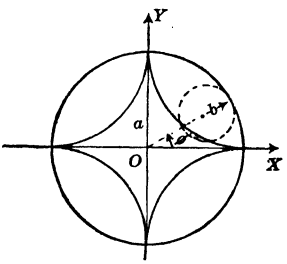

Fig. 38

97. Hypocycloid of four cusps (Fig. 38).

$x^{\frac{2}{3}} + y^{\frac{2}{3}} = a^{\frac{2}{3}}$.

$x = a\cos^3\phi$, $y = a\sin^3\phi$.

The radius of fixed circle is four times the radius of rolling circle.

98. Involute of the Circle (Fig. 39).

$$\begin{cases} x = a\cos\phi + a\phi\sin\phi, \\ y = a\sin\phi - a\phi\cos\phi. \end{cases}$$

A curve generated by the end of a string which is kept taut while being unwound from a circle.

102. Coördinates (Fig. 45).

(*a*) *Rectangular system.* The position of a point P (x, y, z) in space is fixed by its three distances x, y, and z from three coördinate planes XOY, XOZ, ZOY, which are mutually perpendicular and meet in a point O (origin).

(*b*) *Cylindrical system.* The position of any point P (r, θ, z) is fixed by (r, θ), the polar coördinates of the projection of P in the XOY plane, and by z, its distance from the XOY plane.

(c) *Spherical (or polar or geographical) system.* The position of any point $P(\rho, \theta, \phi)$ is fixed by the distance $\rho = \overline{OP}$, the angle $\theta = \angle XOM$, and the angle $\phi = \angle ZOP$. θ is called the *longitude* and ϕ the *co-latitude.*

The following relations exist between the three coördinates systems:

$$\begin{cases} x = \rho \sin\phi \cos\theta, \\ y = \rho \sin\phi \sin\theta, \\ z = \rho \cos\phi. \end{cases} \qquad \begin{cases} r = \rho \sin\phi, \\ z = \rho \cos\phi. \end{cases} \qquad \begin{cases} \rho = \sqrt{r^2 + z^2}, \\ \cos\phi = \dfrac{z}{\sqrt{r^2 + z^2}}. \end{cases}$$

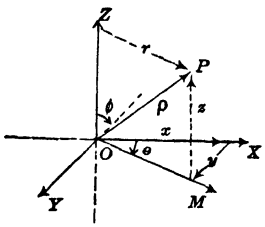

Fig. 45

103. Points, Lines, and Planes. Distance between two points $P_1(x_1, y_1, z_1)$ and $P_2(x_2, y_2, z_2)$, is

$$d = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}.$$

Direction cosines of a line are the cosines of the angles α, β, γ which the line or any parallel line makes with the coördinate axes.

The direction cosines of the line segment $P_1(x_1, y_1, z_1)$ to $P_2(x_2, y_2, z_2)$ are:

$$\cos\alpha = \frac{x_2 - x_1}{d}, \quad \cos\beta = \frac{y_2 - y_1}{d}, \quad \cos\gamma = \frac{z_2 - z_1}{d}.$$

If $\cos\alpha : \cos\beta : \cos\gamma = a : b : c$, then

$$\cos\alpha = \frac{a}{\sqrt{a^2 + b^2 + c^2}}, \cos\beta = \frac{b}{\sqrt{a^2 + b^2 + c^2}}, \cos\gamma = \frac{c}{\sqrt{a^2 + b^2 + c^2}}.$$

$$\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1.$$

Angle θ between two lines, whose direction angles are α_1, β_1, γ_1, and α_2, β_2, γ_2, is given by

$$\cos\theta = \cos\alpha_1 \cos\alpha_2 + \cos\beta_1 \cos\beta_2 + \cos\gamma_1 \cos\gamma_2.$$

Equation of a plane is

$$Ax + By + Cz + D = 0,$$

where A, B, C are proportional to the direction cosines of a normal (a line perpendicular to the plane) to the plane.

Angle between two planes is the angle between their normals.

Equation of a straight line through the point P_1 (x_1, y_1, z_1) is

$$\frac{x - x_1}{a} = \frac{y - y_1}{b} = \frac{z - z_1}{c},$$

where a, b, c are proportional to direction cosines of line.

V. DIFFERENTIAL CALCULUS

105. Definition of Function. A variable y is said to be a *function* of the variable x, if, for every x, (taken at will on its range), y is determined. The symbols $f(x)$, $F(x)$, $g(x)$, $\phi(x)$, etc., are used to represent various functions of x. The symbol $f(a)$ represents the value of $f(x)$ when $x = a$.

106. Definition of Derivative and Notation. Let $y = f(x)$ be a single-valued (continuous) function of x. Let Δx be any increment (increase or decrease) given to x, and let Δy be the corresponding increment in y. The *derivative* of y with respect to x is the limit, (if it exists), of the ratio of Δy to Δx as Δx approaches zero in any manner whatsoever; that is,

$$\frac{dy}{dx} = \lim_{\Delta x \to 0} \frac{\Delta y}{\Delta x} = \lim_{\Delta x \to 0} \frac{f(x+\Delta x) - f(x)}{\Delta x} = f'(x) = D_x y = y'.$$

Higher derivatives are defined as follows:

$$\frac{d^2y}{dx^2} = \frac{d}{dx}\left(\frac{dy}{dx}\right) = \frac{d}{dx} f'(x) = f''(x). \qquad \text{(2nd derivative.)}$$

$$\frac{d^3y}{dx^3} = \frac{d}{dx}\left(\frac{d^2y}{dx^2}\right) = \frac{d}{dx} f''(x) = f'''(x). \qquad \text{(3rd derivative.)}$$

$$\frac{d^ny}{dx^n} = \frac{d}{dx}\left(\frac{d^{n-1}y}{dx^{n-1}}\right) = \frac{d}{dx} f^{(n-1)}(x) = f^{(n)}(x). \qquad \text{(}n\text{th derivative.)}$$

The symbol $f^{(n)}(a)$ represents the value of $f^{(n)}(x)$ when $x = a$.

107. Certain Relations among Derivatives.

If $x = f(y)$, then $\dfrac{dy}{dx} = 1 \div \dfrac{dx}{dy}$.

If $y = f(u)$, and $u = F(x)$, then $\dfrac{dy}{dx} = \dfrac{dy}{du} \cdot \dfrac{du}{dx}$.

If $x = f(\alpha)$, $y = \phi(\alpha)$, then

$$\frac{dy}{dx} = \frac{\phi'(\alpha)}{f'(\alpha)}, \quad \frac{d^2y}{dx^2} = \frac{f'(\alpha)\cdot\phi''(\alpha) - \phi'(\alpha)\cdot f''(\alpha)}{[f'(\alpha)]^3}.$$

108. Table of Derivatives. In this table, u and v represent functions of x; a, n, e represent constants ($e = 2.7183\cdots$), and all angles are measured in radians.

$$\frac{d}{dx}(x) = 1. \qquad \frac{d}{dx}(a) = 0.$$

$$\frac{d}{dx}(u \pm v \pm \cdots) = \frac{du}{dx} \pm \frac{dv}{dx} \pm \cdots.$$

$$\frac{d}{dx}(au) = a\frac{du}{dx}. \qquad \frac{d}{dx}(uv) = u\frac{dv}{dx} + v\frac{du}{dx}.$$

$$\frac{d}{dx}\left(\frac{u}{v}\right) = \frac{v\frac{du}{dx} - u\frac{dv}{dx}}{v^2}. \qquad \frac{d}{dx}\sin u = \cos u\frac{du}{dx}.$$

$$\frac{d}{dx}(u^n) = nu^{n-1}\frac{du}{dx}. \qquad \frac{d}{dx}\cos u = -\sin u\frac{du}{dx}.$$

$$\frac{d}{dx}\log_a u = \frac{\log_a e}{u}\frac{du}{dx}. \qquad \frac{d}{dx}\tan u = \sec^2 u\frac{du}{dx}.$$

$$\frac{d}{dx}\log_e u = \frac{1}{u}\frac{du}{dx}. \qquad \frac{d}{dx}\operatorname{ctn} u = -\csc^2 u\frac{du}{dx}.$$

$$\frac{d}{dx}a^u = a^u \cdot \log_e a \cdot \frac{du}{dx}. \qquad \frac{d}{dx}\sec u = \sec u\tan u\frac{du}{dx}.$$

$$\frac{d}{dx}e^u = e^u\frac{du}{dx}. \qquad \frac{d}{dx}\csc u = -\csc u\operatorname{ctn} u\frac{du}{dx}.$$

$$\frac{d}{dx}u^v = vu^{v-1}\frac{du}{dx} + u^v\log_e u\frac{dv}{dx}. \qquad \frac{d}{dx}\operatorname{vers} u = \sin u\frac{du}{dx}$$

$$\lim_{x\to 0}\frac{\sin x}{x} = 1, \lim_{x\to 0}(1+x)^{1/x} = e = 2.71828\cdots = 1+1+\frac{1}{2!}+\frac{1}{3!}+\cdots.$$

$$\frac{d}{dx}\sin^{-1} u = \frac{1}{\sqrt{1-u^2}}\frac{du}{dx}, \qquad \frac{-\pi}{2} \leqq \sin^{-1} u \leqq \frac{\pi}{2}.$$

$$\frac{d}{dx}\cos^{-1} u = -\frac{1}{\sqrt{1-u^2}}\frac{du}{dx}, \qquad 0 \leqq \cos^{-1} u \leqq \pi.$$

$$\frac{d}{dx}\tan^{-1} u = \frac{1}{1+u^2}\frac{du}{dx}. \qquad \frac{d}{dx}\operatorname{ctn}^{-1} u = -\frac{1}{1+u^2}\frac{du}{dx}.$$

$$\frac{d}{dx}\sec^{-1} u = \frac{1}{u\sqrt{u^2-1}}\frac{du}{dx}, \quad -\pi \leqq \sec^{-1} u < -\frac{\pi}{2}, \quad 0 \leqq \sec^{-1} u < \frac{\pi}{2}.$$

$$\frac{d}{dx}\csc^{-1} u = -\frac{1}{u\sqrt{u^2-1}}\frac{du}{dx}, \quad -\pi < \csc^{-1} u \leqq -\frac{\pi}{2}, \; 0 < \csc^{-1} u \leqq \frac{\pi}{2}.$$

$$\frac{d}{dx}\operatorname{vers}^{-1} u = \frac{1}{\sqrt{2u-u^2}}\frac{du}{dx}, \qquad 0 \leqq \operatorname{vers}^{-1} u \leqq \pi.$$

$$\frac{d}{dx}\sinh u = \cosh u \frac{du}{dx}. \qquad \frac{d}{dx}\cosh u = \sinh u \frac{du}{dx}.$$

$$\frac{d}{dx}\tanh u = \operatorname{sech}^2 u \frac{du}{dx}. \qquad \frac{d}{dx}\operatorname{ctnh} u = -\operatorname{csch}^2 u \frac{du}{dx}.$$

$$\frac{d}{dx}\operatorname{sech} u = -\operatorname{sech} u \tanh u \frac{du}{dx}. \qquad \frac{d}{dx}\operatorname{csch} u = -\operatorname{csch} u \operatorname{ctnh} u \frac{du}{dx}.$$

$$\frac{d}{dx}\sinh^{-1} u = \frac{1}{\sqrt{u^2+1}}\frac{du}{dx}. \qquad \frac{d}{dx}\cosh^{-1} u = \frac{1}{\sqrt{u^2-1}}\frac{du}{dx}, \; u>1$$

$$\frac{d}{dx}\tanh^{-1} u = \frac{1}{1-u^2}\frac{du}{dx}. \qquad \frac{d}{dx}\operatorname{ctnh}^{-1} u = -\frac{1}{u^2-1}\frac{du}{dx}.$$

$$\frac{d}{dx}\operatorname{sech}^{-1} u = -\frac{1}{u\sqrt{1-u^2}}\frac{du}{dx}, \; u>0. \qquad \frac{d}{dx}\operatorname{csch}^{-1} u = -\frac{1}{u\sqrt{u^2+1}}\frac{du}{dx}.$$

109. Slope of a Curve. Equation of Tangent and Normal (Rectangular Coördinates). The slope of the curve $y = f(x)$ at the point $P(x, y)$ is defined as the slope of the tangent line to the curve at P.

Slope $= m = \tan\alpha = \dfrac{dy}{dx} = f'(x)$.

Slope at $x = x_1$ is $m_1 = f'(x_1)$.

Equation of *tangent line* to curve at $P_1(x_1, y_1)$ is

$$y - y_1 = m_1(x - x_1).$$

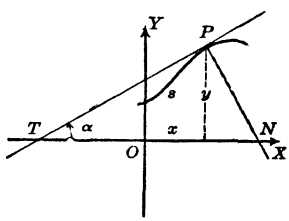

Fig. 55

Equation of *normal line* to curve at $P_1(x_1, y_1)$ is

$$y - y_1 = -\frac{1}{m_1}(x - x_1).$$

Angle (θ) *of intersection of two curves* whose slopes are m_1 and m_2 at the common point is given by

$$\tan\theta = \frac{m_2 - m_1}{1 + m_1 m_2}.$$

110. Differential. If $y = f(x)$, Δx is an increment of x, and $f'(x)$ is the derivative of $f(x)$ with respect to x, then the differential of x equals the increment of x, or $dx = \Delta x$; and the differential of y, dy, is the product of $f'(x)$ and the increment of x;

$$dy = f'(x)dx = \frac{df(x)}{dx}dx = \frac{dy}{dx}dx, \quad \text{and } f'(x) = \frac{dy}{dx}.$$

If $x = f(t)$, $y = \phi(t)$, then $dx = f'(t)\,dt$ and $dy = \phi'(t)\,dt$.

Every derivative formula has a corresponding differential formula. For example, from Table of §108,

$$d(\sin u) = \cos u \cdot du; \qquad d(u \cdot v) = u\,dv + v\,du.$$

111. Maximum and Minimum Values of a Function. A *maximum* (*minimum*) value of a function $f(x)$ in the interval (a, b) is a value of the function which is greater (less) than the values of the function in the immediate vicinity.

The values of x which give a maximum or minimum value to $y = f(x)$ are found by solving the equations $f'(x) = 0$ or ∞. If a be a root of $f'(x) = 0$ and if $f''(a) < 0$, $f(a)$ is a maximum; if $f''(a) > 0$, $f(a)$ is a minimum. If $f''(a) = 0$, $f'''(a) \neq 0$, $f(a)$ is neither a maximum or a minimum, but if $f''(a) = f'''(a) = 0$, $f(a)$ is maximum or minimum according as $f^{IV}(a) \lesseqgtr 0$.

In general, if the first derivative which does not vanish for $x = a$ is of an odd order, $f(a)$ is neither a maximum or a minimum; but if it is of an even order, the $2n$th, say, then $f(a)$ is a maximum or minimum according as $f^{(2n)}(a) \lesseqgtr 0$.

To find the largest or smallest values of a function in an interval (a, b), find $f(a)$, $f(b)$ and compare with the maximum and minimum values as found in the interval.

112. Points of Inflection of a Curve. The curve is said to have a *point of inflection* at $x = a$ if $f''(a) = 0$ and $f''(x) < 0$ on one side of $x = a$ and $f''(x) > 0$ on the other side of $x = a$. Wherever $f''(x) < 0$, the curve is *concave downward*, and wherever $f''(x) > 0$, the curve is *concave upward*.

113. Derivative of Arc Length. Radius of Curvature (See §75, §107, §126). Let s be the length of arc measured along the curve $y = f(x)$, [or in polar coördinates $r = \phi(\theta)$], from some fixed point to any point $P(x, y)$, and α be the angle of inclination of the tangent line at P with OX. Then

$$\frac{dx}{ds} = \cos\alpha = \frac{1}{\sqrt{1 + \left(\frac{dy}{dx}\right)^2}}, \quad \frac{dy}{ds} = \sin\alpha = \frac{1}{\sqrt{1 + \left(\frac{dx}{dy}\right)^2}},$$

$$ds = \sqrt{dx^2 + dy^2} = \sqrt{1 + \left(\frac{dy}{dx}\right)^2} \cdot dx = \sqrt{1 + \left(\frac{dx}{dy}\right)^2} \cdot dy.$$

$$ds = \sqrt{dr^2 + r^2 d\theta^2} = \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} \cdot d\theta = \sqrt{1 + r^2\left(\frac{d\theta}{dr}\right)^2} \cdot dr.$$

If $x = r\cos\theta$, $y = r\sin\theta$,
$dx = \cos\theta \cdot dr - r\sin\theta \cdot d\theta$, $dy = \sin\theta \cdot dr + r\cos\theta \cdot d\theta$.

The *radius* of *curvature* R at any point $P(x, y)$ of the curve $y = f(x)$ is

$$R = \frac{ds}{d\alpha} = \frac{\left[1 + \left(\frac{dy}{dx}\right)^2\right]^{\frac{3}{2}}}{\left(\frac{d^2y}{dx^2}\right)} = \frac{\{1 + [f'(x)]^2\}^{\frac{3}{2}}}{f''(x)},$$

$$R = \frac{\left[r^2 + \left(\frac{dr}{d\theta}\right)^2\right]^{\frac{3}{2}}}{r^2 + 2\left(\frac{dr}{d\theta}\right)^2 - r\frac{d^2r}{d\theta^2}}.$$

The *curvature* (K) at (x, y) is $K = \frac{1}{R}$.

The *center* of *curvature* corresponding to the point (x_1, y_1) on $y = f(x)$ is (h, k), where

$$h = x_1 - \frac{f'(x_1)\{1 + [f'(x_1)]^2\}}{f''(x_1)},$$

$$k = y_1 + \frac{1 + [f'(x_1)]^2}{f''(x_1)}.$$

114. Theorem of the Mean. Rolle's Theorem. If $y = f(x)$ and its derivative $f'(x)$ be continuous on the interval (a, b), there exists a value of x somewhere between a and b such that

$$f(b) = f(a) + (b - a) f'(x_1), \quad a < x_1 < b.$$

Rolle's Theorem is a special case of the Theorem of the Mean with $f(a) = f(b) = 0$; i. e., there exists at least one value of x between a and b for which $f'(x_1) = 0$.

115. Evaluation of Indeterminate Forms. If $f(x)$ and $F(x)$ be two continuous functions of x having continuous derivatives, $f'(x)$ and $F'(x)$, then:

(*a*) If $\lim_{x \to a} f(x) = 0$ and $\lim_{x \to a} F(x) = 0$, and $\lim_{x \to a} F'(x) \neq 0$,

[or if $\lim_{x \to a} f(x) = \lim_{x \to a} F(x) = \infty$], then

$$\lim_{x \to a} \frac{f(x)}{F(x)} = \lim_{x \to a} \frac{f'(x)}{F'(x)}.$$

(*b*) If $\lim_{x \to a} f(x) = 0$ and $\lim_{x \to a} F(x) = \infty$, [i.e. $F(x)$ becomes infinite as x approaches a as a limit], then $\lim_{x \to a} [f(x) \cdot F(x)]$ may often be determined by writing

$$f(x) \cdot F(x) = \frac{f(x)}{1/F(x)},$$

thus expressing the functions in the form of (*a*).

(*c*) If $\lim_{x \to a} f(x) = \infty$ and $\lim_{x \to a} F(x) = \infty$, then $\lim_{x \to a} [f(x) - F(x)]$ may often be determined by writing

$$f(x) - F(x) = \frac{1/F(x) - 1/f(x)}{1/[f(x) \cdot F(x)]},$$

and using (*a*).

(*d*) The $\lim_{x \to a} \left[f(x)^{F(x)} \right]$ may frequently be evaluated upon writing

$$f(x)^{F(x)} = e^{F(x) \cdot \log_e f(x)}.$$

When one factor of the last exponent approaches zero and the other becomes infinite, the exponent is of the type considered in (*b*).

Thus we are led to the indeterminate forms which are symbolized by

$$0/0,\ {}^{\infty}/_{\infty},\ 0^0,\ 1^{\infty},\ \infty^0.$$

116. Taylor's and Maclaurin's Theorem. Any function (continuous and having derivatives) may, in general, be expanded into a *Taylor's Series*,

$$f(x) = f(a) + f'(a)\cdot\frac{(x-a)}{1!} + f''(a)\cdot\frac{(x-a)^2}{2!} + f'''(a)\cdot\frac{(x-a)^3}{3!} + \cdots + f^{(n-1)}(a)\cdot\frac{(x-a)^{n-1}}{(n-1)!} + R_n,$$

where a is any quantity for which $f(a), f'(a), f''(a), \cdots$ are finite.

If the series is to be used for approximating $f(x)$ for some value of x, then a should be picked so that the difference $(x-a)$ is numerically very small, and thus only a few terms of the series need be used. The remainder, after n terms, is $R_n = f^{(n)}(x_1)\cdot(x-a)^n/n!$, where x_1 lies between a and x. R_n gives the limits of error in using n terms of the series for the approximation of the function.

$$n! = \underline{|n} = 1\cdot 2\cdot 3\cdot 4\cdot\cdots\cdot n.$$

If $a = 0$, the above series is called *Maclaurin's Series.*

$$f(x) = f(0) + f'(0)\frac{x}{1!} + f''(0)\frac{x^2}{2!} + f'''(0)\frac{x^3}{3!} + \cdots + f^{(n-1)}(0)\frac{x^{n-1}}{(n-1)!} + R_n.$$

117. Series. The following series may be obtained through the expansion of the functions by Taylor's or Maclaurin's Theorems. The expressions following a series indicate the region of convergence of the series, that is, the values of x for which R_n approaches zero as n becomes infinite, so that an approximation of the function may be obtained by using a number of terms of the series. If the region of convergence is not indicated, the series converges for all finite values of x. $(n! = 1\cdot 2\cdot 3\cdots n)$. $\mathrm{Log}_e u \equiv \mathrm{Log}\, u$.

(*a*) *Binomial Series.*

$$(a + x)^n = a^n + na^{n-1}x + \frac{n(n-1)}{2!}a^{n-2}x^2 + \frac{n(n-1)(n-2)}{3!}a^{n-3}x^3 + \cdots, \quad x^2 < a^2.$$

If n is a positive integer, the series consists of $(n + 1)$ terms; otherwise, the number of terms is infinite.

$$(a - bx)^{-1} = \frac{1}{a}\left(1 + \frac{bx}{a} + \frac{b^2x^2}{a^2} + \frac{b^3x^3}{a^3} \cdots\right), \quad b^2x^2 < a^2.$$

(*b*) *Exponential, Logarithmic, and Trigonometric Series.**

$$e = 1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \cdots.$$

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots.$$

$$a^x = 1 + x \log a + \frac{(x \log a)^2}{2!} + \frac{(x \log a)^3}{3!} + \cdots.$$

$$e^{-x^2} = 1 - x^2 + \frac{x^4}{2!} - \frac{x^6}{3!} + \frac{x^8}{4!} - \cdots.$$

$$\log x = (x-1) - \tfrac{1}{2}(x-1)^2 + \tfrac{1}{3}(x-1)^3 - \cdots, \qquad 0 < x \leqq 2.$$

$$\log x = \frac{x-1}{x} + \frac{1}{2}\left(\frac{x-1}{x}\right)^2 + \frac{1}{3}\left(\frac{x-1}{x}\right)^3 + \cdots, \qquad x > \frac{1}{2}.$$

$$\log x = 2\left[\frac{x-1}{x+1} + \frac{1}{3}\left(\frac{x-1}{x+1}\right)^3 + \frac{1}{5}\left(\frac{x-1}{x+1}\right)^5 + \cdots\right], \qquad x > 0.$$

$$\log (1 + x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots.$$

$$\log (a + x) = \log a + 2\left[\frac{x}{2a+x} + \frac{1}{3}\left(\frac{x}{2a+x}\right)^3 + \frac{1}{5}\left(\frac{x}{2a+x}\right)^5 + \cdots\right], \quad a > 0, \; -a < x < +\infty.$$

$$\log\left(\frac{1+x}{1-x}\right) = 2\left(x + \frac{x^3}{3} + \frac{x^5}{5} + \frac{x^7}{7} + \cdots\right), \qquad x^2 < 1.$$

$$\log\left(\frac{x+1}{x-1}\right) = 2\left[\frac{1}{x} + \frac{1}{3}\left(\frac{1}{x}\right)^3 + \frac{1}{5}\left(\frac{1}{x}\right)^5 + \frac{1}{7}\left(\frac{1}{x}\right)^7 + \cdots\right], \quad x^2 > 1.$$

$$\log\left(\frac{x+1}{x}\right) = 2\left[\frac{1}{2x+1} + \frac{1}{3(2x+1)^3} + \frac{1}{5(2x+1)^5} + \cdots\right], \quad x > 0.$$

* $\log u \equiv \log_e u$.

$$\log (x + \sqrt{1+x^2}) = x - \frac{1}{2}\frac{x^3}{3} + \frac{1\cdot 3}{2\cdot 4}\frac{x^5}{5} - \frac{1\cdot 3\cdot 5}{2\cdot 4\cdot 6}\frac{x^7}{7} + \cdots, \quad x^2 < 1.$$

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots.$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \cdots.$$

$$\tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \frac{17x^7}{315} + \frac{62x^9}{2835} + \cdots, \quad x^2 < \frac{\pi^2}{4}.$$

$$\sin^{-1} x = x + \frac{x^3}{6} + \frac{1}{2}\cdot\frac{3}{4}\cdot\frac{x^5}{5} + \frac{1}{2}\cdot\frac{3}{4}\cdot\frac{5}{6}\cdot\frac{x^7}{7} + \cdots, \quad x^2 < 1.$$

$$\tan^{-1} x = x - \frac{1}{3}x^3 + \frac{1}{5}x^5 - \frac{1}{7}x^7 + \cdots, \quad x^2 < 1.$$

$$= \frac{\pi}{2} - \frac{1}{x} + \frac{1}{3x^3} - \frac{1}{5x^5} + \cdots, \quad x^2 > 1.$$

$$\log \sin x = \log x - \frac{x^2}{6} - \frac{x^4}{180} - \frac{x^6}{2835} - \cdots, \quad x^2 < \pi^2.$$

$$\log \cos x = -\frac{x^2}{2} - \frac{x^4}{12} - \frac{x^6}{45} - \frac{17x^8}{2520} - \cdots, \quad x^2 < \frac{\pi^2}{4}.$$

$$\log \tan x = \log x + \frac{x^2}{3} + \frac{7x^4}{90} + \frac{62x^6}{2835} + \cdots, \quad x^2 < \frac{\pi^2}{4}.$$

$$e^{\sin x} = 1 + x + \frac{x^2}{2!} - \frac{3x^4}{4!} - \frac{8x^5}{5!} - \frac{3x^6}{6!} + \cdots.$$

$$e^{\cos x} = e\left(1 - \frac{x^2}{2!} + \frac{4x^4}{4!} - \frac{31x^6}{6!} + \cdots\right).$$

$$e^{\tan x} = 1 + x + \frac{x^2}{2!} + \frac{3x^3}{3!} + \frac{9x^4}{4!} + \frac{37x^5}{5!} + \cdots, \quad x^2 < \frac{\pi^2}{4}.$$

$$\sinh x = x + \frac{x^3}{3!} + \frac{x^5}{5!} + \frac{x^7}{7!} + \cdots.$$

$$\cosh x = 1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \frac{x^6}{6!} + \cdots.$$

$$\tanh x = x - \frac{x^3}{3} + \frac{2x^5}{15} - \frac{17x^7}{315} + \cdots.$$

$$\sinh^{-1} x = x - \frac{1}{2}\frac{x^3}{3} + \frac{1\cdot 3}{2\cdot 4}\frac{x^5}{5} - \frac{1\cdot 3\cdot 5}{2\cdot 4\cdot 6}\frac{x^7}{7} + \cdots, \quad x^2 < 1.$$

$$\sinh^{-1} x = \log 2x + \frac{1}{2}\frac{1}{2x^2} - \frac{1\cdot 3}{2\cdot 4}\frac{1}{4x^4} + \frac{1\cdot 3\cdot 5}{2\cdot 4\cdot 6}\frac{1}{6x^6} \cdots, \quad x > 1.$$

$$\cosh^{-1} x = \log 2x - \frac{1}{2}\frac{1}{2x^2} - \frac{1\cdot 3}{2\cdot 4}\frac{1}{4x^4} - \frac{1\cdot 3\cdot 5}{2\cdot 4\cdot 6}\frac{1}{6x^6} - \cdots.$$

$$\tanh^{-1} x = x + \frac{x^3}{3} + \frac{x^5}{5} + \frac{x^7}{7} + \cdots, \quad x^2 < 1.$$

118. Partial Derivatives. Differentials. If $z = f(x, y)$, is a function of two variables, then the derivative of z with respect to x, as x varies while y remains constant, is called the *first partial derivative of z with respect to x* and is denoted by $\frac{\partial z}{\partial x}$. Similarly, the derivative of z with respect to y, as y varies while x remains constant, is called the *first partial derivative of z with respect to y* and is denoted by $\frac{\partial z}{\partial y}$.

Similarly, if $z = f(x, y, u, \cdots)$, then the first derivative of z with respect to x, as x varies while y, u, $\cdots$ remain constant, is called the first partial of z with respect to x and is denoted by $\frac{\partial z}{\partial x}$. Likewise, the second partial derivatives are defined as indicated below:

$$\frac{\partial^2 z}{\partial x^2} = \frac{\partial}{\partial x}\left(\frac{\partial z}{\partial x}\right); \quad \frac{\partial^2 z}{\partial y^2} = \frac{\partial}{\partial y}\left(\frac{\partial z}{\partial y}\right); \quad \frac{\partial^2 z}{\partial x\,\partial y} = \frac{\partial}{\partial x}\left(\frac{\partial z}{\partial y}\right) = \frac{\partial}{\partial y}\left(\frac{\partial z}{\partial x}\right) = \frac{\partial^2 z}{\partial y\,\partial x}.$$

If $z = f(x, y, \cdots, u)$, and $x, y, \cdots, u$ are functions of a single variable t, then

$$\frac{dz}{dt} = \frac{\partial z}{\partial x}\frac{dx}{dt} + \frac{\partial z}{\partial y}\frac{dy}{dt} + \cdots + \frac{\partial z}{\partial u}\frac{du}{dt},$$

$$dz = \frac{\partial z}{\partial x}dx + \frac{\partial z}{\partial y}dy + \cdots + \frac{\partial z}{\partial u}du,$$

If $F(x, y, z, \cdots, u) = 0$, then $\frac{\partial F}{\partial x}dx + \frac{\partial F}{\partial y}dy + \cdots + \frac{\partial F}{\partial u}du = 0.$

119. Surfaces. Space Curves (See Analytic Geometry §97-8.) The *tangent plane* to the surface $F(x, y, z) = 0$ at the point (x_1, y_1, z_1) on the surface is

$$(x - x_1)\left(\frac{\partial F}{\partial x}\right)_1 + (y - y_1)\left(\frac{\partial F}{\partial y}\right)_1 + (z - z_1)\left(\frac{\partial F}{\partial z}\right)_1 = 0,$$

where $\left(\frac{\partial F}{\partial x}\right)_1$ is the value of $\frac{\partial F}{\partial x}$ at (x_1, y_1, z_1), etc.

The equations of the *normal* to the surface at (x_1, y_1, z_1) are

$$\frac{x - x_1}{\left(\frac{\partial F}{\partial x}\right)_1} = \frac{y - y_1}{\left(\frac{\partial F}{\partial y}\right)_1} = \frac{z - z_1}{\left(\frac{\partial F}{\partial z}\right)_1}.$$

The *direction cosines* of the normal to the surface at the point (x_1, y_1, z_1) are proportional to

$$\left(\frac{\partial F}{\partial x}\right)_1, \left(\frac{\partial F}{\partial y}\right)_1, \left(\frac{\partial F}{\partial z}\right)_1.$$

Given the *space* curve $x = x(t)$, $y = y(t)$, $z = z(t)$. The direction cosines of the tangent line to the curve at any point are proportional to

$$\frac{dx}{dt}, \frac{dy}{dt}, \frac{dz}{dt}, \text{ or to } dx, dy, dz.$$

The equations of the *tangent line* to the curve at (x_1, y_1, z_1) on the curve are

$$\frac{x - x_1}{\left(\frac{dx}{dt}\right)_1} = \frac{y - y_1}{\left(\frac{dy}{dt}\right)_1} = \frac{z - z_1}{\left(\frac{dz}{dt}\right)_1},$$

where $\left(\frac{dx}{dt}\right)_1$ is the value of $\frac{dx}{dt}$ at (x_1, y_1, z_1), etc.

VI. INTEGRAL CALCULUS

120. Definition of Indefinite Integral. $F(x)$ is said to be an *indefinite integral of* $f(x)$, if the derivative of $F(x)$ is $f(x)$, or the differential of $F(x)$ is $f(x)dx$; symbolically:

$$F(x) = \int f(x)dx \text{ if } \frac{dF(x)}{dx} = f(x), \text{ or } dF(x) = f(x)dx.$$

In general: $\int f(x)dx = F(x) + C$, where C is an arbitrary constant.

121. Fundamental Theorems on Integrals. Short Table of Integrals.* (u and v denote functions of x; a, b and C denote constants).

1. $\int df(x) = f(x) + C.$

2. $d\int f(x)dx = f(x)dx.$

3. $\int 0 \cdot dx = C.$

4. $\int a f(x)\, dx = a\int f(x)\, dx.$

5. $\int (u \pm v)dx = \int udx \pm \int vdx.$

6. $\int u\, dv = uv - \int v\, du.$

7. $\int \frac{u\, dv}{dx}\, dx = uv - \int v \frac{du}{dx}\, dx.$

8. $\int f(y)dx = \int \frac{f(y)dy}{\frac{dy}{dx}}.$

9. $\int u^n\, du = \frac{u^{n+1}}{n+1} + C,\ n \neq -1.$

10. $\int \frac{du}{u} = \log_e u + C.$

11. $\int e^u\, du = e^u + C.$

12. $\int b^u\, du = \frac{b^u}{\log_e b} + C.$

13. $\int \sin u\, du = -\cos u + C.$

14. $\int \cos u\, du = \sin u + C.$

*See §14R.

15. $\int \tan u\, du = \log_e \sec u + C = -\log_e \cos u + C.$

16. $\int \operatorname{ctn} u\, du = \log_e \sin u + C = -\log_e \csc u + C.$

17. $\int \sec u\, du = \log_e(\sec u + \tan u) + C = \log_e \tan\left(\frac{u}{2} + \frac{\pi}{4}\right) + C.$

18. $\int \csc u\, du = \log_e(\csc u - \operatorname{ctn} u) + C = \log_e \tan \frac{u}{2} + C.$

19. $\int \sin^2 u\, du = \frac{1}{2}u - \frac{1}{2}\sin u \cos u + C.$

20. $\int \cos^2 u\, du = \frac{1}{2}u + \frac{1}{2}\sin u \cos u + C.$

21. $\int \sec^2 u\, du = \tan u + C.$

22. $\int \csc^2 u\, du = -\operatorname{ctn} u + C.$

23. $\int \tan^2 u\, du = \tan u - u + C.$

24. $\int \operatorname{ctn}^2 u\, du = -\operatorname{ctn} u - u + C.$

25. $\int \frac{du}{u^2 + a^2} = \frac{1}{a}\tan^{-1}\frac{u}{a} + C.$

26. $\int \frac{du}{u^2 - a^2} = \frac{1}{2a}\log_e\left(\frac{u-a}{u+a}\right) + C = -\frac{1}{a}\operatorname{ctnh}^{-1}\left(\frac{u}{a}\right) + C$, if $u^2 > a^2$,

$= \frac{1}{2a}\log_e\left(\frac{a-u}{a+u}\right) + C = -\frac{1}{a}\tanh^{-1}\left(\frac{u}{a}\right) + C$, if $u^2 < a^2$.

27. $\int \frac{du}{\sqrt{a^2 - u^2}} = \sin^{-1}\left(\frac{u}{a}\right) + C.$

28. $\int \frac{du}{\sqrt{u^2 \pm a^2}} = \log_e\left(u + \sqrt{u^2 \pm a^2}\right)^* + C.$

*See footnote on page 50.

29. $\int \frac{du}{\sqrt{2au - u^2}} = \cos^{-1}\left(\frac{a-u}{a}\right) + C.$

30. $\int \frac{du}{u\sqrt{u^2 - a^2}} = \frac{1}{a}\sec^{-1}\left(\frac{u}{a}\right) + C = \frac{1}{a}\cos^{-1}\frac{a}{u} + C.$

31. $\int \frac{du}{u\sqrt{a^2 \pm u^2}} = -\frac{1}{a}\log_e\left(\frac{a + \sqrt{a^2 \pm u^2}}{u}\right)^* + C.$

32. $\int \sqrt{a^2 - u^2}\cdot du = \frac{1}{2}\left(u\sqrt{a^2 - u^2} + a^2 \sin^{-1}\frac{u}{a}\right) + C.$

33. $\int \sqrt{u^2 \pm a^2}\,du = \frac{1}{2}\left[u\sqrt{u^2 \pm a^2} \pm a^2 \log_e\left(u + \sqrt{u^2 \pm a^2}\right)\right]^* + C.$

34. $\int \sinh u\,du = \cosh u + C.$

35. $\int \cosh u\,du = \sinh u + C.$

36. $\int \tanh u\,du = \log_e(\cosh u) + C.$

37. $\int \operatorname{ctnh} u\,du = \log_e(\sinh u) + C.$

38. $\int \operatorname{sech} u\,du = \sin^{-1}(\tanh u) + C.$

39. $\int \operatorname{csch} u\,du = \log_e\left(\tanh\frac{u}{2}\right) + C.$

40. $\int \operatorname{sech} u \cdot \tanh u \cdot du = -\operatorname{sech} u + C.$

41. $\int \operatorname{csch} u \cdot \operatorname{ctnh} u \cdot du = -\operatorname{csch} u + C.$

---

* $\log_e\left(\frac{u+\sqrt{u^2+a^2}}{a}\right) = \sinh^{-1}\left(\frac{u}{a}\right)$; $\log_e\left(\frac{a+\sqrt{a^2-u^2}}{u}\right) = \operatorname{sech}^{-1}\left(\frac{u}{a}\right)$;

$\log_e\left(\frac{u+\sqrt{u^2-a^2}}{a}\right) = \cosh^{-1}\left(\frac{u}{a}\right)$; $\log_e\left(\frac{a+\sqrt{a^2+u^2}}{u}\right) = \operatorname{csch}^{-1}\left(\frac{u}{a}\right)$.

Definite Integrals

122. Definition of Definite Integral. Let $f(x)$ be continuous for the interval from $x = a$ to $x = b$ inclusive. Divide this interval into n equal parts by the points $a, x_1, x_2, \cdots, x_{n-1}, b$ such that $\Delta x = (b - a)/n$. The definite integral of $f(x)$ with respect to x between the limits $x = a$ to $x = b$ is

$$\int_a^b f(x)\,dx = \lim_{n\to\infty} [f(a)\Delta x + f(x_1)\Delta x + f(x_2)\Delta x + \cdots + f(x_{n-1})\Delta x].$$

$$\int_a^b f(x)\,dx = \left[\int f(x)\,dx\right]_a^b = \Big[F(x)\Big]_a^b = F(b) - F(a),$$

where $F(x)$ is a function whose derivative with respect to x is $f(x)$.

123. Approximate Values of Definite Integral. Approximate values of the above definite integral are given by the rules of §41, where $y_0, y_1, y_2, \cdots, y_{n-1}, y_n$ are the values of $f(x)$ for $x = a, x_1, x_2, \cdots, x_{n-1}, b$, respectively, and $h = (b - a)/n$.

124. Some Fundamental Theorems.

$$\int_a^b [f_1(x) + f_2(x) + \cdots + f_n(x)]\,dx = \int_a^b f_1(x)\,dx + \int_a^b f_2(x)\,dx + \cdots + \int_a^b f_n(x)\,dx.$$

$$\int_a^b kf(x)\,dx = k\int_a^b f(x)\,dx, \quad \text{if } k \text{ is a constant.}$$

$$\int_a^b f(x)\,dx = -\int_b^a f(x)\,dx.$$

$$\int_a^b f(x)\,dx = \int_a^c f(x)\,dx + \int_c^b f(x)\,dx.$$

$$\int_a^b f(x)\,dx = (b - a)\,f(x_1), \quad \text{where } x_1 \text{ lies between } a \text{ and } b.$$

$$\int_a^\infty f(x)\,dx = \lim_{t\to\infty}\int_a^t f(x)\,\mathrm{dx}.$$

$$\int_{-\infty}^b f(x)\,dx = \lim_{t\to\infty}\int_{-t}^b f(x)\,dx.$$

$$\int_{-\infty}^{+\infty} f(x)\,dx = \int_{-\infty}^{c} f(x)dx + \int_{c}^{\infty} f(x)dx.$$

If $f(x)$ has a singular point* at $x = b$, $b \neq a$,

$$\int_a^b f(x)dx = \lim_{e \to 0} \int_a^{b-e} f(x)dx.$$

The mean value of the function $f(x)$ on the interval (a, b) is

$$\frac{1}{b-a}\int_a^b f(x)dx.$$

Some Applications of the Definite Integral

125. Plane Area. The area bounded by $y = f(x)$, $y = 0$, $x = a$, $x = b$, where y has the same sign for all values of x between a and b, is

$$A = \int_a^b f(x)\,dx, \quad dA = f(x)\,dx.$$

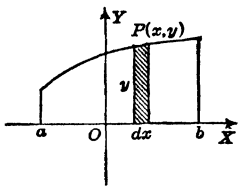

Fig. 56

The area bounded by the curve $r = f(\theta)$ and the two radii $\theta = \alpha$, $\theta = \beta$, is

$$A = \frac{1}{2}\int_\alpha^\beta [f(\theta)]^2\,d\theta, \quad dA = \frac{1}{2}r^2 \cdot d\theta.$$

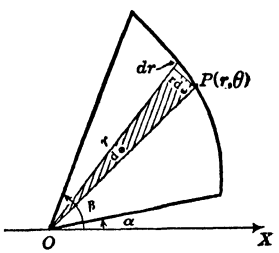

Fig. 57

126. Length of Arc (See §113). The length (s) of arc of a plane curve $f(x, y) = 0$ from the point (a, c) to the point (b, d) is

$$s = \int_a^b \sqrt{1 + \left(\frac{dy}{dx}\right)^2} \cdot dx = \int_c^d \sqrt{1 + \left(\frac{dx}{dy}\right)^2} \cdot dy.$$

If the equation of the curve is $x = f(t)$, $y = f(t)$, the length of arc from $t = a$ to $t = b$ is

$$s = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} \cdot dt.$$

*For example, when $\lim_{x \to b} f(x) = \infty$.

If the equation of the curve is $r = f(\theta)$, then

$$s = \int_{\theta_1}^{\theta_2} \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} \cdot d\theta = \int_{r_1}^{r_2} \sqrt{r^2 \left(\frac{d\theta}{dr}\right)^2 + 1} \cdot dr.$$

127. Volume by Parallel Sections. If the plane perpendicular to the x-axis at $(x, 0, 0)$ cuts from a given solid a section whose area is $A(x)$, then the volume of that part of the solid between $x = a$ and $x = b$ is

$$\int_a^b A(x)dx.$$

128. Volume of Revolution. The volume of a solid of revolution generated by revolving that portion of the curve $y = f(x)$ between $x = a$ and $x = b$

(*a*) about the x-axis is $\pi \int_a^b y^2\, dx$;

(*b*) about the y-axis is $\pi \int_c^d x^2\, dy$, where c and d are the values of y corresponding to the values a and b of x.

129. Area of Surface of Revolution. The area of the surface of a solid of revolution generated by revolving the curve $y = f(x)$ between $x = a$ and $x = b$

(*a*) about the x-axis is $2\pi \int_a^b y \sqrt{1 + \left(\frac{dy}{dx}\right)^2} \cdot dx$,

(*b*) about the y-axis is $2\pi \int_a^b x \sqrt{1 + \left(\frac{dx}{dy}\right)^2} \cdot dy$.

130. Plane Areas by Double Integration.

(*a*) Rectangular coördinates,

$$A = \int_a^b \int_{\varphi(x)}^{f(x)} dy\, dx \text{ or } \int_c^d \int_{\xi(y)}^{\Psi(y)} dx\, dy;$$

(*b*) Polar coördinates,

$$A = \int_{\theta_1}^{\theta_2} \int_{f_1(\theta)}^{f_2(\theta)} r\, dr\, d\theta \text{ or } \int_{r_1}^{r_2} \int_{\phi_1(r)}^{\phi_2(r)} r\, d\theta\, dr.$$

131. Volumes by Double Integration. *If* $z=f(x,y)$,

$$V = \int_a^b \int_{\phi(x)}^{\Psi(x)} f(x,y)\, dy\, dx \quad \text{or} \quad \int_c^d \int_{\alpha(y)}^{\beta(y)} f(x,y)\, dx\, dy.$$

132. Volumes by Triple Integration (see §102).

(*a*) Rectangular coördinates,

$$V = \int\int\int dx\, dy\, dz;$$

(*b*) Cylindrical coördinates,

$$V = \int\int\int r\, dr\, d\theta\, dz;$$

(*c*) Spherical coördinates,

$$V = \int\int\int \rho^2 \sin\phi\, d\theta\, d\phi\, d\rho.$$

where the limits of integration must be supplied. Other formulas may be obtained by changing the order of integration.

Area of Surface $z = f(x, y)$

$$A = \int\int \sqrt{\left(\frac{\partial z}{\partial x}\right)^2 + \left(\frac{\partial z}{\partial y}\right)^2 + 1}\ \cdot\ dy\, dx,$$

where the limits of integration must be supplied.

133. Mass.* The mass of a body of density δ is

$$m = \int dm, \quad dm = \delta \cdot dA, \quad \text{or} \quad \delta \cdot ds, \quad \text{or} \quad \delta \cdot dV, \quad \text{or} \quad \delta \cdot dS,$$

where dA, ds, dV, dS are, respectively, the elements of area, length, volume, surface of §125 to §132.

134. Density.* If δ is a variable (or constant) density (mass per unit of element), and $\bar{\delta}$ is the mean density of a solid of volume V, then

$$\bar{\delta} = \frac{\int \delta\, dV}{\int dV}$$

*The limits of integration are to be supplied

135. Moment.* The moments M_{yz}, M_{xz}, M_{xy}, of a mass m with respect to the coordinate planes (as indicated by the subscripts) are

$$M_{yz} = \int x\, dm, \quad M_{xz} = \int y\, dm, \quad M_{xy} = \int z\, dm.$$

136. Centroid of Mass or Center of Gravity.* The coordinates $(\bar{x}, \bar{y}, \bar{z})$ of the centroid of a mass m are

$$\bar{x} = \frac{\int x\, dm}{\int dm}, \quad \bar{y} = \frac{\int y\, dm}{\int dm}, \quad \bar{z} = \frac{\int z\, dm}{\int dm}.$$

(Note: In the above equations x, y, z are the coordinates of the center of gravity of the element dm.)

137. Centroid of Several Masses. The x-coordinate $(\bar{x})$ of the centroid of several masses $m_1, m_2, \cdots, m_n$, having $\bar{x}_1, \bar{x}_2, \cdots, \bar{x}_n$, respectively as the x-coordinates of their centroids, is

$$\bar{x} = \frac{m_1\bar{x}_1 + m_2\bar{x}_2 + \cdots + m_n\bar{x}_n}{m_1 + m_2 + \cdots + m_n},$$

Similar formulas hold for the other coordinates $\bar{y}$, $\bar{z}$.

138. Moment of Inertia (Second Moment).* The moments of inertia (I):

(*a*) for a plane curve about the x-axis, y-axis, and origin, respectively, are:

$$I_x = \int y^2\, ds, \qquad I_y = \int x^2\, ds, \quad I_0 = \int (x^2 + y^2)\, ds;$$

(*b*) for a plane area about the x-axis, y-axis, and origin, respectively, are:

$$I_x = \int y^2\, dA, \quad I_y = \int x^2\, dA, \quad I_0 = \int (x^2 + y^2)\, dA;$$

(*c*) for a solid of mass m about the yz, xz, xy-planes, x-axis, etc., respectively, are:

$$I_{yz} = \int x^2\, dm, \quad I_{xz} = \int y^2\, dm, \quad I_{xy} = \int z^2\, dm, \quad I_x = I_{xz} + I_{xy}, \quad \text{etc.}$$

*The limits of integration are to be supplied.

139. Radius of Gyration. If I is the moment of inertia of a mass m, and K is the radius of gyration, $I = mK^2$. Similarly for areas, lengths, volumes, etc.

If masses (or areas, etc.) $m_1, m_2, \cdots, m_n$, have respectively the radii of gyration $k_1, k_2, \cdots, k_n$, with respect to a line or plane, then with respect to this line or plane, the several masses taken together have the radius of gyration K, where

$$K^2 = \frac{m_1k^2_1 + m_2k^2_2 + \cdots + m_nk^2_n}{m_1+m_2 + \cdots + m_n}.$$

140. Work. The work W done in moving a particle from $s = a$ to $s = b$ against a force whose component expressed as function of s in the direction of motion is F_s, is

$$W = \int_{s=a}^{s=b} F_s\, ds, \qquad dW = F_s\, ds.$$

141. Pressure. The pressure (p) against an area vertical to the surface of a liquid and between the depths a and b is

$$P = \int_{y=a}^{y=b} wly\, dy, \qquad dp = wly\, dy,$$

where w is the weight of liquid per unit volume, y is the depth beneath surface of liquid of a horizontal element of area, and l is the length of the horizontal element of area expressed in terms of y.

142. Center of Pressure. The depth $\bar{y}$ of the center of pressure against an area vertical to the surface of the liquid and between the depths a and b is

$$\bar{y} = \frac{\int_{y=a}^{y=b} ydp}{\int_{y=a}^{y=b} dp} \cdot \text{ (for } dp \text{ see §141).}$$

VII. TABLE OF INTEGRALS

Certain Elementary Processes

143. To integrate $\int R(x) \cdot dx$, where $R(x)$ is a rational function of x.

Write $R(x)$ in the form of a fraction whose terms are polynomials. If the fraction is improper, (i.e., the degree of the denominator is less than or equal to the degree of the numerator), divide the numerator by the denominator and thus write $R(x)$ as the sum of a quotient $Q(x)$ and a proper fraction $P(x)$. (In a proper fraction the degree of the numerator is less than the degree of the denominator.) The polynomial $Q(x)$ is readily integrated. To integrate $P(x)$ separate it into a sum of partial fractions (as indicated below), and integrate each term of the sum separately.

To separate the proper fraction $P(x)$ into partial fractions, write $P(x) = f(x)/\psi(x)$, where $f(x)$ and $\psi(x)$ are polynomials,

$$\psi(x) = (x-a)^p (x-b)^q (x-c)^r \cdots,$$

and the constants a, b, c, are all different. By algebra, there exist constants $A_1, A_2, \cdots, B_1, B_2, \cdots$, such that

$$\frac{f(x)}{\psi(x)} = \frac{A_1}{(x-a)} + \frac{A_2}{(x-a)^2} + \cdots + \frac{A_p}{(x-a)^p} + \frac{B_1}{(x-b)} + \frac{B_2}{(x-b)^2} + \cdots + \frac{B_q}{(x-b)^q} + \cdots.$$

The separate terms of this sum may be integrated by the formulas

$$\int \frac{dx}{(x-\alpha)^t} = \frac{-1}{(t-1)(x-\alpha)^{t-1}}, \quad t > 1, \qquad \int \frac{dx}{(x-\alpha)} = \log(x-\alpha).$$

If $f(x)$ and $\psi(x)$ have real coefficients and $\psi(x) = 0$ has imaginary roots the above method leads to imaginary quantities. To avoid this, separate $P(x)$ in a different way. As before, corresponding to each p-fold real root a of $\psi(x)$, use the sum

$$\frac{A_1}{(x-a)} + \frac{A_2}{(x-a)^2} + \cdots + \frac{A_p}{(x-a)^p}.$$

To each λ-fold real quadratic factor $x^2 + \alpha x + \beta$ of $\psi(x)$ which does not factor into real linear factors, use, instead of the two sets of terms occurring in the first expansion of $R(x)$ and dependent on the conjugate complex roots of $x^2 + \alpha x + \beta = 0$, sums of the form

$$\frac{D_1 x + E_1}{(x^2 + \alpha x + \beta)} + \frac{D_2 x + E_2}{(x^2 + \alpha x + \beta)^2} + \cdots + \frac{D_\lambda x + E_\lambda}{(x^2 + \alpha x + \beta)^\lambda},$$

where the quantities $D_1, D_2, \cdots, E_1, E_2, \cdots$, are real constants.

These new sums may be separately integrated by means of Integral formulas 149 to 156, etc.

144. To Integrate an Irrational Algebraic Function. If no convenient method of integration is apparent the integration may frequently be performed by means of a change of variable. For example, if R is a rational function of two arguments and n is an integer, then to integrate

(*a*) $\int R\left[x, (ax + b)^{\frac{1}{n}}\right] dx$, let $(ax + b) = y^n$, whence the integral reduces to $\int P(y)\, dy$, where $P(y)$ is a rational function of y and may be integrated as in §143;

(*b*) $\int R\left[x, (x^2 + bx + c)^{\frac{1}{2}}\right] dx$, let $(x^2 + bx + c)^{\frac{1}{2}} = z - x$, reduce R to a rational function of z, and proceed as in §143;

(*c*) $\int R(\sin x, \cos x)\, dx$, let $\tan \frac{x}{2} = t$, whence

$$\sin x = \frac{2t}{1 + t^2}, \quad \cos x = \frac{1 - t^2}{1 + t^2}, \quad dx = \frac{2\, dt}{1 + t^2},$$

reduce R to a rational function of t and proceed as in §143.

145. To Integrate Expressions Containing $\sqrt{a^2 - x^2}$, $\sqrt{x^2 \pm a^2}$. Expressions containing these radicals can frequently be integrated after making the following transformations:

(*a*) if $\sqrt{a^2 - x^2}$ occurs, let $x = a \sin t$;

(*b*) if $\sqrt{x^2 - a^2}$ occurs, let $x = a \sec t$;

(*c*) if $\sqrt{x^2 + a^2}$ occurs, let $x = a \tan t$.

146. To Integrate Expressions Containing Trigonometric Functions. The integration of such functions may frequently be facilitated by the use of the identities of §58.

147. Integration by Parts. The relation

$$\int u\,dv = u\,v - \int v\,du.$$

is often effective in reducing a given integral to one or more simpler integrals.

*Table of Integrals**

148. In the following table, the constant of integration, C, is omitted but should be added to the result of every integration. The letter x represents any variable; u represents any function of x; the remaining letters represent arbitrary constants, unless otherwise indicated; all angles are in radians. **Unless otherwise mentioned $\log_e u \equiv \log u$.**

Expressions Containing $(ax + b)$.

42. $\int (ax+b)^n dx = \dfrac{1}{a\,(n+1)}\,(ax+b)^{n+1},\quad n \neq -1.$

43. $\int \dfrac{dx}{ax+b} = \dfrac{1}{a}\log_e\,(ax+b).$

44. $\int \dfrac{dx}{(ax+b)^2} = -\dfrac{1}{a(ax+b)}.$

45. $\int \dfrac{dx}{(ax+b)^3} = -\dfrac{1}{2a(ax+b)^2}.$

46. $\int x(ax+b)^n\,dx = \dfrac{1}{a^2(n+2)}\,(ax+b)^{n+2} - \dfrac{b}{a^2(n+1)}\,(ax+b)^{n+1},\ n \neq -1,\ -2.$

47. $\int \dfrac{x\,dx}{ax+b} = \dfrac{x}{a} - \dfrac{b}{a^2}\log\,(ax+b).$

48. $\int \dfrac{x\,dx}{(ax+b)^2} = \dfrac{b}{a^2(ax+b)} + \dfrac{1}{a^2}\log\,(ax+b).$

*See §121.

49. $$\int \frac{x\,dx}{(ax+b)^3} = \frac{b}{2a^2(ax+b)^2} - \frac{1}{a^2(ax+b)}.$$

50. $$\int x^2(ax+b)^n dx = \frac{1}{a^3}\left[\frac{(ax+b)^{n+3}}{n+3} - 2b\,\frac{(ax+b)^{n+2}}{n+2} + b^2\frac{(ax+b)^{n+1}}{n+1}\right], \quad n \neq -1, -2, -3.$$

51. $$\int \frac{x^2 dx}{ax+b} = \frac{1}{a^3}\left[\frac{1}{2}(ax+b)^2 - 2b(ax+b) + b^2\log(ax+b)\right].$$

52. $$\int \frac{x^2 dx}{(ax+b)^2} = \frac{1}{a^3}\left[(ax+b) - 2b\log(ax+b) - \frac{b^2}{ax+b}\right].$$

53. $$\int \frac{x^2\,dx}{(ax+b)^3} = \frac{1}{a^3}\left[\log(ax+b) + \frac{2b}{ax+b} - \frac{b^2}{2(ax+b)^2}\right]$$

54. $$\int x^m(ax+b)^n\,dx$$
$$= \frac{1}{a(m+n+1)}\left[x^m(ax+b)^{n+1} - mb\int x^{m-1}(ax+b)^n dx\right],$$
$$= \frac{1}{m+n+1}\left[x^{m+1}(ax+b)^n + nb\int x^m(ax+b)^{n-1}dx\right],$$
$$m > 0,\ m+n+1 \neq 0.$$

55. $$\int \frac{dx}{x(ax+b)} = \frac{1}{b}\log\frac{x}{ax+b}.$$

56. $$\int \frac{dx}{x^2(ax+b)} = -\frac{1}{bx} + \frac{a}{b^2}\log\frac{ax+b}{x}.$$

57. $$\int \frac{dx}{x^3(ax+b)} = \frac{2ax-b}{2b^2x^2} + \frac{a^2}{b^3}\log\frac{x}{ax+b}.$$

58. $$\int \frac{dx}{x(ax+b)^2} = \frac{1}{b(ax+b)} - \frac{1}{b^2}\log\frac{ax+b}{x}.$$

59. $$\int \frac{dx}{x(ax+b)^3} = \frac{1}{b^3}\left[\frac{1}{2}\left(\frac{ax+2b}{ax+b}\right)^2 + \log\frac{x}{ax+b}\right].$$

60. $$\int \frac{dx}{x^2(ax+b)^2} = -\frac{b+2ax}{b^2x(ax+b)} + \frac{2a}{b^3}\log\frac{ax+b}{x}.$$

61. $\int \sqrt{ax+b}\,dx = \frac{2}{3a}\sqrt{(ax+b)^3}$

62. $\int x\sqrt{ax+b}\,dx = \frac{2(3ax-2b)}{15a^2}\sqrt{(ax+b)^3}$

63. $\int x^2\sqrt{ax+b}\,dx = \frac{2(15a^2x^2-12abx+8b^2)\sqrt{(ax+b)^3}}{105a^3}$

64. $\int x^3\sqrt{ax+b}\,dx$
$= \frac{2(35a^3x^3-30a^2bx^2+24ab^2x-16b^3)\sqrt{(ax+b)^3}}{315a^4}.$

65. $\int x^n\sqrt{ax+b}\,dx = \frac{2}{a^{n+1}}\int u^2(u^2-b)^n du,\ u=\sqrt{ax+b}.$

66. $\int \frac{\sqrt{ax+b}}{x}\,dx = 2\sqrt{ax+b} + b\int \frac{dx}{x\sqrt{ax+b}}.$

67. $\int \frac{dx}{\sqrt{ax+b}} = \frac{2\sqrt{ax+b}}{a}.$

68. $\int \frac{xdx}{\sqrt{ax+b}} = \frac{2(ax-2b)}{3a^2}\sqrt{ax+b}.$

69. $\int \frac{x^2dx}{\sqrt{ax+b}} = \frac{2(3a^2x^2-4abx+8b^2)}{15a^3}\sqrt{ax+b}.$

70. $\int \frac{x^3dx}{\sqrt{ax+b}} = \frac{2(5a^3x^3-6a^2bx^2+8ab^2x-16b^3)}{35a^4}\sqrt{ax+b}.$

71. $\int \frac{x^ndx}{\sqrt{ax+b}} = \frac{2}{a^{n+1}}\int (u^2-b)^n du,\ u=\sqrt{ax+b}.$

72. $\int \frac{dx}{x\sqrt{ax+b}} = \frac{1}{\sqrt{b}}\log\frac{\sqrt{ax+b}-\sqrt{b}}{\sqrt{ax+b}+\sqrt{b}},$ for $b>0.$

73. $\int \frac{dx}{x\sqrt{ax+b}} = \frac{2}{\sqrt{-b}}\tan^{-1}\sqrt{\frac{ax+b}{-b}},\ b<0;\ \frac{-2}{\sqrt{b}}\tanh^{-1}\sqrt{\frac{ax+b}{b}},\ b>0.$

74. $$\int \frac{dx}{x^2\sqrt{ax+b}} = -\frac{\sqrt{ax+b}}{bx} - \frac{a}{2b}\int \frac{dx}{x\sqrt{ax+b}}.$$

75. $$\int \frac{dx}{x^3\sqrt{ax+b}} = -\frac{\sqrt{ax+b}}{2bx^2} + \frac{3a\sqrt{ax+b}}{4b^2x} + \frac{3a^2}{8b^2}\int \frac{dx}{x\sqrt{ax+b}}.$$

76. $$\int \frac{dx}{x^n(ax+b)^m} = -\frac{1}{b^{m+n-1}}\int \frac{(u-a)^{m+n-2}du}{u^m},\ u = \frac{ax+b}{x}.$$

77. $$\int (ax+b)^{\pm\frac{n}{2}}dx = \frac{2(ax+b)^{\frac{2\pm n}{2}}}{a(2\pm n)}.$$

78. $$\int x(ax+b)^{\pm\frac{n}{2}}dx = \frac{2}{a^2}\left[\frac{(ax+b)^{\frac{4\pm n}{2}}}{4\pm n} - \frac{b(ax+b)^{\frac{2\pm n}{2}}}{2\pm n}\right].$$

79. $$\int \frac{dx}{x(ax+b)^{\frac{n}{2}}} = \frac{1}{b}\int \frac{dx}{x(ax+b)^{\frac{n-2}{2}}} - \frac{a}{b}\int \frac{dx}{(ax+b)^{\frac{n}{2}}}.$$

80. $$\int \frac{x^m dx}{\sqrt{ax+b}} = \frac{2x^m\sqrt{ax+b}}{(2m+1)a} - \frac{2mb}{(2m+1)a}\int \frac{x^{m-1}dx}{\sqrt{ax+b}}.$$

81. $$\int \frac{dx}{x^n\sqrt{ax+b}} = \frac{-\sqrt{ax+b}}{(n-1)bx^{n-1}} - \frac{(2n-3)a}{(2n-2)b}\int \frac{dx}{x^{n-1}\sqrt{ax+b}}.$$

82. $$\int \frac{(ax+b)^{\frac{n}{2}}}{x}dx = a\int (ax+b)^{\frac{n-2}{2}}dx + b\int \frac{(ax+b)^{\frac{n-2}{2}}}{x}dx.$$

83. $$\int \frac{dx}{(ax+b)(cx+d)} = \frac{1}{bc-ad}\log\frac{cx+d}{ax+b},\ bc-ad \neq 0.$$

84. $$\int \frac{dx}{(ax+b)^2(cx+d)} = \frac{1}{bc-ad}\left[\frac{1}{ax+b} + \frac{c}{bc-ad}\log\left(\frac{cx+d}{ax+b}\right)\right], bc-ad \neq 0.$$

85. $$\int (ax+b)^n(cx+d)^m\,dx = \frac{1}{(m+n+1)a}\Big[(ax+b)^{n+1}(cx+d)^m - m(bc-ad)\int (ax+b)^n(cx+d)^{m-1}\,dx\Big].$$

86. $$\int \frac{dx}{(ax+b)^n(cx+d)^m} = \frac{1}{(m-1)(bc-ad)}\left[\frac{1}{(ax+b)^{n-1}(cx+d)^{m-1}}\right.$$
$$\left. -a(m+n-2)\int \frac{dx}{(ax+b)^n(cx+d)^{m-1}}\right], \; m>1,\; n>0,\; bc-ad\neq 0.$$

87. $$\int \frac{(ax+b)^n}{(cx+d)^m}\,dx$$
$$= -\frac{1}{(m-1)(bc-ad)}\left[\frac{(ax+b)^{n+1}}{(cx+d)^{m-1}} + (m-n-2)a\int \frac{(ax+b)^n dx}{(cx+d)^{m-1}}\right],$$
$$= \frac{-1}{(m-n-1)c}\left[\frac{(ax+b)^n}{(cx+d)^{m-1}} + n(bc-ad)\int \frac{(ax+b)^{n-1}}{(cx+d)^m}\,dx\right].$$

88. $$\int \frac{xdx}{(ax+b)(cx+d)} = \frac{1}{bc-ad}\left[\frac{b}{a}\log(ax+b)\right.$$
$$\left. -\frac{d}{c}\log(cx+d)\right], \; bc-ad\neq 0.$$

89. $$\int \frac{xdx}{(ax+b)^2(cx+d)} = \frac{1}{bc-ad}\left[-\frac{b}{a(ax+b)}\right.$$
$$\left. -\frac{d}{bc-ad}\log\frac{cx+d}{ax+b}\right], \; bc-ad\neq 0.$$

379. $\int_0^\infty e^{-a^2x^2}\,dx = \frac{\sqrt{\pi}}{2a} = \frac{1}{2a}\,\Gamma\left(\frac{1}{2}\right)$, if $a > 0$.

380. $\int_0^\infty x^n \cdot e^{-ax}\,dx = \frac{\Gamma(n+1)}{a^{n+1}}$,
$= \frac{n!}{a^{n+1}}$, if n is a positive integer, $a > 0$.

381. $\int_0^\infty x^{2n} e^{-ax^2}\,dx = \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{2^{n+1}a^n}\sqrt{\frac{\pi}{a}}$.

382. $\int_0^\infty \sqrt{x}\; e^{-ax}\,dx = \frac{1}{2a}\sqrt{\frac{\pi}{a}}$.

383. $\int_0^\infty \frac{e^{-ax}}{\sqrt{x}}\,dx = \sqrt{\frac{\pi}{a}}.$

384. $\int_0^\infty e^{(-x^2-a^2/x^2)}\,dx = \frac{1}{2}e^{-2a}\sqrt{\pi}$, if $a>0$.

385. $\int_0^\infty e^{-ax}\cos bx\,dx = \frac{a}{a^2+b^2}$, if $a>0$.

386. $\int_0^\infty e^{-ax}\sin bx\,dx = \frac{b}{a^2+b^2}$, if $a>0$.

387. $\int_0^\infty \frac{e^{-ax}\sin x}{x}\,dx = \operatorname{ctn}^{-1} a,\ a>0.$

388. $\int_0^\infty e^{-a^2x^2}\cos bx\,dx = \frac{\sqrt{\pi}\cdot e^{-\frac{b^2}{4a^2}}}{2a}$, if $a>0$.

389. $\int_0^1 (\log x)^n\,dx = (-1)^n\cdot n!$, n pos. integ.

390. $\int_0^1 \frac{\log x}{1-x}dx = -\frac{\pi^2}{6}.$

391. $\int_0^1 \frac{\log x}{1+x}\,dx = -\frac{\pi^2}{12}.$

392. $\int_0^1 \frac{\log x}{1-x^2}\,dx = -\frac{\pi^2}{8}.$

393. $\int_0^1 \frac{\log x}{\sqrt{1-x^2}}\,dx = -\frac{\pi}{2}\log 2.$

394. $\int_0^1 \log\left(\frac{1+x}{1-x}\right)\cdot\frac{dx}{x} = \frac{\pi^2}{4}.$

395. $\int_0^\infty \log\left(\frac{e^x+1}{e^x-1}\right)dx = \frac{\pi^2}{4}.$

396. $\int_0^1 \frac{dx}{\sqrt{\log(1/x)}} = \sqrt{\pi}.$

397. $\int_0^1 \log(\log x)\,dx = \int_0^\infty e^{-x}\log x\,dx = \gamma = 0.5772157\cdots.$

398. $\int_0^{\frac{\pi}{2}} \log\sin x\,dx = \int_0^{\frac{\pi}{2}} \log\cos x\,dx = -\frac{\pi}{2}\cdot\log_e 2.$

399. $\int_0^{\pi} x\log\sin x\,dx = -\frac{\pi^2}{2}\cdot\log_e 2.$

400. $\int_0^1 \left(\log\frac{1}{x}\right)^{\frac{1}{2}} dx = \frac{\sqrt{\pi}}{2}.$

401. $\int_0^1 \left(\log\frac{1}{x}\right)^{-\frac{1}{2}} dx = \sqrt{\pi}.$

402. $\int_0^1 x^m \log\left(\frac{1}{x}\right)^n dx = \frac{\Gamma(n+1)}{(m+1)^{n+1}}$, if $m+1>0, \quad n+1>0.$

403. $\int_0^{\pi} \log(a\pm b\cos x)\,dx = \pi\log\left(\frac{a+\sqrt{a^2-b^2}}{2}\right),\ a\geqq b.$

404. $\int_0^{\pi} \frac{\log(1+\sin a\cos x)}{\cos x}\,dx = \pi a.$

405. $\int_0^1 \frac{x^b-x^a}{\log x}\,dx = \log\frac{1+b}{1+a}.$

406. $\int_0^{\pi} \frac{dx}{a+b\cos x} = \frac{\pi}{\sqrt{a^2-b^2}}$, if $a>b>0.$

407. $\int_0^{\frac{\pi}{2}} \frac{dx}{a+b\cos x} = \frac{\cos^{-1}\left(\frac{b}{a}\right)}{\sqrt{a^2-b^2}},\ a>b.$

408. $\int_0^{\infty} \frac{\cos ax\,dx}{1+x^2} = \frac{\pi}{2}\cdot e^{-a}$, if $a>0$; $= \frac{\pi}{2}e^{a}$, if $a<0.$

409. $\int_0^{\infty} \frac{\cos x\,dx}{\sqrt{x}} = \int_0^{\infty} \frac{\sin x\,dx}{\sqrt{x}} = \sqrt{\frac{\pi}{2}}.$

410. $\int_0^\infty \frac{e^{-ax} - e^{-bx}}{x}\,dx = \log\frac{b}{a}.$

411. $\int_0^\infty \frac{\tan^{-1} ax - \tan^{-1} bx}{x}\,dx = \frac{\pi}{2}\log\frac{a}{b}.$

412. $\int_0^\infty \frac{\cos ax - \cos bx}{x}\,dx = \log\frac{b}{a}.$

413. $\int_0^{\frac{\pi}{2}} \frac{dx}{a^2\cos^2 x + b^2\sin^2 x} = \frac{\pi}{2ab}.$

414. $\int_0^{\frac{\pi}{2}} \frac{dx}{(a^2\cos^2 x + b^2\sin^2 x)^2} = \frac{\pi(a^2+b^2)}{4a^3b^3}.$

415. $\int_0^\pi \frac{(a - b\cos x)\,dx}{a^2 - 2ab\cos x + b^2} = 0, \quad \text{if } a^2 < b^2;$

$= \frac{\pi}{a}, \quad \text{if } a^2 > b^2;$

$= \frac{\pi}{2a}, \quad \text{if } a = b.$

416. $\int_0^1 \frac{1+x^2}{1+x^4}\,dx = \frac{\pi}{4}\sqrt{2}.$

417. $\int_0^1 \frac{\log(1+x)}{x}\,dx = \frac{1}{1^2} - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \cdots = \frac{\pi^2}{12}$

418. $\int_{-\infty}^1 \frac{e^{-xu}}{u}\,du = \gamma + \log x - x + \frac{x^2}{2\cdot 2!} - \frac{x^3}{3\cdot 3!} + \frac{x^4}{4\cdot 4!} - \cdots,$

where $\gamma = \lim_{t\to\infty}(1+\frac{1}{2}+\frac{1}{3}+\cdots+\frac{1}{t} - \log t) = 0.5772157\cdots.$

419. $\int_{-\infty}^1 \frac{\cos xu}{u}\,du = \gamma + \log x - \frac{x^2}{2\cdot 2!} + \frac{x^4}{4\cdot 4!} - \frac{x^6}{6\cdot 6!} + \cdots,$

where $\gamma = 0.5772157\cdots.$

420. $\int_0^1 \frac{e^{xu} - e^{-xu}}{u}\,du = 2\left(x + \frac{x^3}{3\cdot 3!} + \frac{x^5}{5\cdot 5!} + \cdots\right).$

421. $\int_0^1 \frac{1 - e^{-xu}}{u}\,du = x - \frac{x^2}{2\cdot 2!} + \frac{x^3}{3\cdot 3!} - \frac{x^4}{4\cdot 4!} + \cdots.$

422. $$\int_0^{\frac{\pi}{2}} \frac{dx}{\sqrt{1-K^2\sin^2 x}} = \frac{\pi}{2}\left[1+\left(\frac{1}{2}\right)^2 K^2+\left(\frac{1\cdot 3}{2\cdot 4}\right)^2 K^4+\left(\frac{1\cdot 3\cdot 5}{2\cdot 4\cdot 6}\right)^2 K^6+\cdots\right],$$ if $K^2<1$.

423. $$\int_0^{\frac{\pi}{2}} \sqrt{1-K^2\sin^2 x}\,dx = \frac{\pi}{2}\left[1-\left(\frac{1}{2}\right)^2 K^2 - \left(\frac{1\cdot 3}{2\cdot 4}\right)^2 \frac{K^4}{3} - \left(\frac{1\cdot 3\cdot 5}{2\cdot 4\cdot 6}\right)^2 \frac{K^6}{5} - \cdots\right],$$ if $K^2<1$.

424. $$f(x) = \tfrac{1}{2}a_0 + a_1\cos\frac{\pi x}{c} + a_2\cos\frac{2\pi x}{c} + \cdots + b_1\sin\frac{\pi x}{c} + b_2\sin\frac{2\pi x}{c} + \cdots, \quad -c<x<+c,$$

where $$a_m = \frac{1}{c}\int_{-c}^{+c} f(x)\cdot\cos\frac{m\pi x}{c}\cdot dx,$$

$$b_m = \frac{1}{c}\int_{-c}^{+c} f(x)\cdot\sin\frac{m\pi x}{c}\,dx.$$ (Fourier Series)

425. $$\int_0^{\infty} e^{-ax}\cosh bx\,dx = \frac{a}{a^2-b^2},\ a>0,\ a^2\neq b^2.$$

426. $$\int_0^{\infty} e^{-ax}\sinh bx\,dx = \frac{b}{a^2-b^2},\ a>0,\ a^2\neq b^2.$$

427. $$\int_0^{\infty} xe^{-ax}\sin bx\,dx = \frac{2ab}{(a^2+b^2)^2},\ a>0.$$

428. $$\int_0^{\infty} xe^{-ax}\cos bx\,dx = \frac{a^2-b^2}{(a^2+b^2)^2},\ a>0.$$

429. $$\int_0^\infty x^2 e^{-ax} \sin bx \, dx = \frac{2b(3a^2 - b^2)}{(a^2 + b^2)^3}, \quad a > 0.$$

430. $$\int_0^\infty x^2 e^{-ax} \cos bx \, dx = \frac{2a(a^2 - 3b^2)}{(a^2 + b^2)^3}, \quad a > 0.$$

431. $$\int_0^\infty x^3 e^{-ax} \sin bx \, dx = \frac{24ab(a^2 - b^2)}{(a^2 + b^2)^4}, \quad a > 0.$$

432. $$\int_0^\infty x^3 e^{-ax} \cos bx \, dx = \frac{6(a^4 - 6a^2b^2 + b^4)}{(a^2 + b^2)^4}, \quad a > 0.$$

433. $$\int_0^\infty x^n e^{-ax} \sin bx \, dx = \frac{i \cdot n! \, [(a - ib)^{n+1} - (a + ib)^{n+1}]}{2(a^2 + b^2)^{n+1}}, \quad a > 0.$$

434. $$\int_0^\infty x^n e^{-ax} \cos bx \, dx = \frac{n! \, [(a - ib)^{n+1} + (a + ib)^{n+1}]}{2(a^2 + b^2)^{n+1}}, \quad a > 0.$$

VIII. Vector Analysis

149. Definitions. Analytic Representation. A *vector* V is a quantity which is completely specified by a magnitude and a direction. A vector may be represented geometrically by a directed line segment $V = \overrightarrow{OA}$. A *scalar* S is a quantity which is completely specified by a magnitude.

Let i, j, k represent three vectors of unit magnitude along the three mutually perpendicular lines OX, OY, OZ, respectively. Let V be a vector in space, and a, b, c the magnitudes of the projections of V along the three lines OX, OY, OZ, respectively. Then V may be represented by $V = a\,i + b\,j + c\,k$. The magnitude of V is $|V| = +\sqrt{a^2 + b^2 + c^2}$, and the direction cosines of V are such that $\cos\alpha : \cos\beta : \cos\gamma = a : b : c$.

150. Vector Sum V of n vectors. Let $V_1, V_2, \cdots, V_n$ be n vectors given by $V_1 = a_1\,i + b_1\,j + c_1\,k$, etc. Then the *sum* is

$$V = V_1 + V_2 + \cdots + V_n = (a_1 + a_2 + \cdots + a_n)\,i + (b_1 + b_2 + \cdots + b_n)\,j + (c_1 + c_2 + \cdots + c_n)\,k.$$

151. Product of a Scalar S and a Vector V.

$$SV = (Sa)i + (Sb)\,j + (Sc)k.$$

$$(S_1 + S_2)\,V = S_1\,V + S_2\,V. \qquad (V_1 + V_2)\,S = V_1\,S + V_2\,S.$$

152. Scalar Product of Two Vectors: $V_1 \cdot V_2$.

$V_1 \cdot V_2 = |V_1||V_2|\cos\phi$, where ϕ is the angle from V_1 to V_2.

$$V_1 \cdot V_2 = a_1 a_2 + b_1 b_2 + c_1 c_2 = V_2 \cdot V_1. \qquad V_1 \cdot V_1 = |V_1|^2.$$

$$(V_1 + V_2) \cdot V_3 = V_1 \cdot V_3 + V_2 \cdot V_3.$$

$$V_1 \cdot (V_2 + V_3) = V_1 \cdot V_2 + V_1 \cdot V_3.$$

$$i \cdot i = j \cdot j = k \cdot k = 1. \qquad i \cdot j = j \cdot k = k \cdot i = 0.$$

153. Vector Product of Two Vectors: $V_1 \times V_2$.

$V_1 \times V_2 = |V_1|\,|V_2| \sin\phi\ \mathbf{1}$, where ϕ is the angle from V_1 to V_2 and $\mathbf{1}$ is a unit vector perpendicular to the plane of V_1 and V_2 and so directed that a right-handed screw driven in the direction of $\mathbf{1}$ would carry V_1 into V_2.

$$V_1 \times V_2 = -\,V_2 \times V_1 = (b_1 c_2 - b_2 c_1)\,i + (c_1 a_2 - c_2 a_1)\,j + (a_1 b_2 - a_2 b_1)\,\mathbf{k}.$$

$$(V_1 + V_2) \times V_3 = V_1 \times V_3 + V_2 \times V_3.$$

$$V_1 \times (V_2 + V_3) = V_1 \times V_2 + V_1 \times V_3.$$

$$V_1 \times (V_2 \times V_3) = V_2\,(V_1 \cdot V_3) - V_3\,(V_1 \cdot V_2).$$

$$i \times i = j \times j = k \times k = 0,\ i \times j = k,\ j \times k = i,\ k \times i = j.$$

$$V_1 \cdot (V_2 \times V_3) = (V_1 \times V_2) \cdot V_3 = V_2 \cdot (V_3 \times V_1) = [V_1\,V_2\,V_3] = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}.$$

154. Differentiation of Vectors. $V = a\,i + b\,j + c\,k$. If V_1, V_2, $\cdots$ are functions of a scalar variable t, then

$$\frac{d}{dt}(V_1 + V_2 + \cdots) = \frac{dV_1}{dt} + \frac{dV_2}{dt} + \cdots, \text{ where}$$

$$\frac{dV_1}{dt} = \frac{da_1}{dt}\,i + \frac{db_1}{dt}\,j + \frac{dc_1}{dt}\,k, \text{ etc.}$$

$$\frac{d}{dt}(V_1 \cdot V_2) = \frac{dV_1}{dt} \cdot V_2 + V_1 \cdot \frac{dV_2}{dt}.$$

$$\frac{d}{dt}(V_1 \times V_2) = \frac{dV_1}{dt} \times V_2 + V_1 \times \frac{dV_2}{dt}.$$

$$V \cdot \frac{dV}{dt} = |V|\,\frac{d|V|}{dt}. \quad \text{If } |V| \text{ is constant, } \quad V \cdot \frac{dV}{dt} = 0.$$

$$\text{grad } S \equiv \nabla S \equiv \frac{\partial S}{\partial x}\,i + \frac{\partial S}{\partial y}\,j + \frac{\partial S}{\partial z}\,k, \text{ where } S \text{ is a scalar.}$$

$$\text{div } V \equiv \nabla \cdot V \equiv \frac{\partial a}{\partial x} + \frac{\partial b}{\partial y} + \frac{\partial c}{\partial z} \quad \text{(divergence of } S\text{)}.$$

$$\text{curl } V \equiv \text{rot } V \equiv \begin{vmatrix} i & j & k \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ a & b & c \end{vmatrix} \equiv \nabla \times V.$$

$$\text{div grad } S \equiv \nabla^2 S \equiv \frac{\partial^2 S}{\partial x^2} + \frac{\partial^2 S}{\partial y^2} + \frac{\partial^2 S}{\partial z^2}.$$

$$\nabla^2 V \equiv i\,\nabla^2 a + j\,\nabla^2 b + k\,\nabla^2 c.$$

$$\text{curl grad } S = 0. \quad \text{div curl} = 0.$$

$$\text{curl curl } V = \text{grad div } V - \nabla^2 V.$$

155. Green's Theorem. Let F be a vector and V be a volume bounded by a surface S. Then

$$\int_{(V)}\int\int \text{div } F\,dV = \int_{(V)}\int\int \nabla \cdot F\,dV = \int_{(S)}\int F \cdot dS,$$

where the integrations are to be carried out over the volume V and the surface S.

156. Stoke's Theorem. Let F be a vector and $dr = dx\,i + dy\,j + dz\,k$, and S be a surface bounded by a simple closed curve C. Then

$$\int_{(C)} F \cdot dr = \int_{(S)}\int \text{curl } F \cdot d\,S = \int_{(S)}\int \nabla \times F \cdot d\,S.$$

PART TWO—TABLES

Explanation of Tables

Table I. Five-Place Common Logarithms of Numbers from 1 to 10,000.

Definition of Logarithm. The *logarithm* x of the number N to the base b is the exponent of the power to which b must be raised to give N. That is,

$$\log_b N = x \quad \text{or} \quad b^x = N.$$

The number N is positive and b may be any positive number except 1.

Properties of Logarithms.

(*a.*) *The logarithm of a product is equal to the sum of the logarithms of the factors; thus,*

$$\log_b M \cdot N = \log_b M + \log_b N.$$

(*b.*) *The logarithm of a quotient is equal to the logarithm of the numerator minus the logarithm of the denominator; thus,*

$$\log_b \frac{M}{N} = \log_b M - \log_b N.$$

(*c.*) *The logarithm of a power of a number is equal to the logarithm of the base multiplied by the exponent of the power; thus,*

$$\log_b M^p = p \cdot \log_b M.$$

(*d.*) *The logarithm of a root of a number is equal to the logarithm of the number divided by the index of the root; thus,*

$$\log_b \sqrt[q]{M} = \frac{1}{q} \log_b M.$$

Other properties of logarithms:

$\log_b b = 1$ · $\log_b \sqrt[q]{M^p} = \frac{p}{q} \cdot \log_b M.$

$\log_b 1 = 0$ · $\log_b N = \log_a N \cdot \log_b a = \frac{\log_a N}{\log_a b}.$

$\log_b (b^N) = N$ · $b^{\log_b N} = N.$

Systems of Logarithms. There are two common systems of logarithms in use: (1) the *natural* (Napierian or hyperbolic),

system which uses the base $e = 2.71828\cdots$; (2) the *common* (Briggsian) system which uses the base 10.

We shall use the abbreviation* $\log N \equiv \log_{10} N$ in this section.

Unless otherwise stated, tables of logarithms are always tables of common logarithms.

Characteristic of a Common Logarithm of a Number. Every real positive number has a real common logarithm such that if $a < b$, $\log a < \log b$. Neither zero nor any negative number has a real logarithm.

A common logarithm, in general, consists of an integer, which is called the *characteristic*, and a decimal (usually endless) which is called the *mantissa*. The characteristic of any number may be determined from the following rules.

Rule I. *The characteristic of any number greater than* 1 *is one less than the number of digits before the decimal point.*

Rule II.† *The characteristic of a number less than* 1 *is found by subtracting from* 9 *the number of ciphers between the decimal point and the first significant digit, and writing* -10 *after the result.*

Thus the characteristic of log 936 is 2; the characteristic of 9.36 is 0; of log 0.936 is $9-10$; of log 0.00936 is $7-10$.

Mantissa of a Common Logarithm of a Number. An important consequence of the use of base 10 is that the mantissa of a number is independent of the position of the decimal point. Thus 93,600, 93.600, 0.000936, all have the same mantissa. Hence in Tables of Common Logarithms only mantissas are given. This is done in Table I. A five place table gives the values of the mantissa correct to five places of decimals.

To Find the Logarithm of a Given Number N. By means of Rules I and II determine the characteristic. Then use Table I to find mantissa.

To find mantissa when the given number (neglecting decimal point) consists of four, or less, digits (exclusive of ciphers at the beginning or end), look in the column marked N for the first three significant digits and pick the column headed by the fourth digit—the mantissa is the number appearing at the intersection of this row and column. Thus to find the logarithm of 64030, first note (by

* Note, however, that $\log N \equiv \log_e N$ is used in the Table of Integrals.

† Some writers use a dash over the characteristic to indicate a negative value: for example, $\log .004657 = 7.66811-10 = \bar{3}.66811$.

Rule I) that the characteristic is 4. Next in Table I, find 640 in column marked N and opposite it in column 5 is the desired mantissa, .80638. Hence log 64030 = 4.80638. Likewise, log 0.0064030 = 7.80638 − 10; log 0.64030 = 9.80638 −10.

Interpolation. The mantissa of a number of more than four significant figures can be found approximately by assuming that the mantissa varies directly as the number in the small interval not tabulated. Thus if N has five digits (significant), and f is the fifth digit of N, the mantissa of N is

$$m = m_1 + \frac{f}{10}\left(m_2 - m_1\right),$$

where m_1 is the mantissa corresponding to the first four digits of N, m_2 is the next larger mantissa in the table. $(m_2 - m_1)$ is called a *tabular difference.* The proportional part of the difference $m_2 - m_1$ is called the *correction.* These proportional parts are printed without zeros at the right-hand side of each page as an aid to mental multiplications.

For example, find log 64034. Here $f = 4$. From the table we see $m_1 = .80638$, $m_2 = .80645$, whence $m = .80638 + (4/10)\,(.00007)$, log 64034 = 4 + m = 4.80641.

To Find the Number N when its Logarithm is Known. (The number N whose logarithm is k is called the *anti logarithm* of k.)

Case 1. If the mantissa m is found exactly in the Table I, join the figure at the top of the column containing m to the right of the figures in the column marked N and in the same row as m, and place the decimal point according to the characteristic of the logarithm.

Case 2. If the mantissa m is not found exactly in the table, interpolate as follows: find the next smaller mantissa m_1 to m; the first four significant digits of N correspond to the mantissa m_1, and the fifth digit f equals the nearest whole number to

$$f = 10\left(\frac{m - m_1}{m_2 - m_1}\right),$$

where m_2 is the next larger mantissa to m appearing in table. Then locate the decimal point according to the characteristic.

The decimal point may be located by means of the following rules:

Rule III. *If the characteristic of the logarithm is positive (then the mantissa is not followed by −10), begin at the left, count digits one more than the characteristic, and place the decimal point to the right of the last digit counted.*

Rule IV. *If the characteristic is negative (then the mantissa will be preceded by an integer n and followed by* -10*), prefix* $(9-n)$ *ciphers, and place the decimal point to the left of these ciphers.*

Illustrations of the Use of Logarithms.

Example 1. Given $\log x = 2.91089$, find x. The mantissa 91089 appears in the table. Join the figure 5 which appears at the top of the column to the right of the number 814 in the column N, giving the number 8145. By Rule III, the decimal point is placed to the right of 4, thus giving $x = 814.5$.

Example 2. Given $\log x = 2.34917$, find x. The mantissa $m = .34917$ does not appear in the table. The next smaller and next larger mantissas are m_1 and m_2,

$$m_1 = .34908, \quad m = .34917, \quad m_2 = .34928.$$

The first four digits of N, corresponding to m_1, are 2234 and the fifth digit is the nearest whole number (5) to

$$10\left(\frac{m - m_1}{m_2 - m_1}\right) = 10\left(\frac{.00009}{.00020}\right) = 4.5.$$

By Rule III, we locate decimal point, thus giving $x = 223.45$.

Example 3. Find $x = (396.21)\,(.004657)\,(21.21)$.

$\log 396.21 = 2.59792$
$\log .004657 = 7.66811 - 10$
$\log 21.210 = 1.32654$ (add)
$\log x = 11.59257 - 10, \quad x = 39.135.$

Example 4. Find $x = \dfrac{396.21^*}{24.3}$.

$\log 396.21 = 2.59792$
$\log 24.3 = 1.38561$ (subtract)
$\log x = 1.21231, \quad x = 16.305.$

Example 5. Find $x = (3.5273)^4$.

$\log 3.5273 = 0.54745$
4 (multiply)
$\log x = 2.18980, \quad x = 154.81.$

* Some writers use *cologarithms*. The cologarithm of a number N is the negative of the logarithm of N; i. e., colog N = 10.00000 − log N − 10. Adding the cologarithm is equivalent to subtracting the logarithm. Thus in our example, colog 24.3 = (10.00000 − 1.38561) − 10 = 8.61439–10, log 396.21 − log 24.3 = log 396.21 + colog 24.3 = 2.59792 + 8.61439–10 = 11.21231–10 = anti log 16.305.

Example 6. Given $\log x = -2.23653$, to find x. To convert this logarithm to one with a positive mantissa, add algebraically -2.23653 to $10.00000-10$. Thus

$$\begin{array}{r} 10.00000-10 \\ -2.23653 \\ \hline 7.76347-10, \end{array}$$

$\log x = 7.76347-10$, whence $x = 0.0058006$.

Example 7. Find $x = \sqrt[3]{.04657}$.

$\log x = \frac{1}{3} \log (.04657)$,

$= \frac{1}{3}(8.66811-10) = \frac{1}{3}(-1.33189)$,

$\log x = -0.44396 = 9.55604-10$, $x = 0.35978$.

or

$\log x = \frac{1}{3}(8.66811-10) = \frac{1}{3}(28.66811-30)$

$\log x = 9.55604-10$, $x = 0.35978$.

Example 8. Find $x = \dfrac{1}{21.210}$.

$\log x = \log 1 - \log 21.210$

$\log 1 = 10.00000-10$

$\log 21.210 = 1.32654$ (subtract)

$\log x = 8.67346-10$, $x = 0.047148$.

Table II. Seven-place Common Logarithms of Numbers. This table gives seven-place logarithms for numbers of five significant figures from 10000 to 12000.

Table III. Important Constants. This table gives the values and logarithms of a number of important constants.

Table IV. Common Logarithms of Trigonometric Functions. In this table, the logarithmic values of the sine, cosine, tangent, and cotangent of angles at intervals of one minute from 0° to 90° are given. Since $\log \sec A = -\log \cos A$ and $\log \csc A = -\log \sin A$, $\log \sec A$ and $\log \csc A$ are omitted. For angles between 0° and 45°, the number of the degrees and the name of the trigonometric function are read at the top of the page and the number of minutes in the left-hand column. The corresponding information for angles between 45° and 90° is found at the bottom of the page and in the right-hand column.

The arrangement and the principles of interpolation are similar to those given in the explanation for Table I. The -10 portion of the characteristic is not printed in the table but must be written down whenever such a logarithm is used, except in the cases of the tan between 45° and 90°, and the ctn between 0° and 45°.

While the logarithmic values of the trigonometric functions may be interpolated to the nearest second, interpolation for the logarithms of the sine and tangent of small angles from 0° to 3° and for the logarithms of the cosine and cotangent of angles from 87° to 90° is not accurate. Table IVa should be used in these cases.

Table IVa gives

$$S = \log \sin A - \log A' \text{ and } T = \log \tan A - \log A',$$

where A is the given angle and A' is the number of minutes in A, for values of A from 0° to 3°. Then

$$\log \sin A = \log A' + S \text{ and } \log \tan A = \log A' + T.$$

Likewise,

$\log \cos A = \log (90° - A)' + S$ and $\log \operatorname{ctn} A = \log (90° - A)' + T$. for values of A from 87° to 90°, the S and T corresponding to $(90° - A)'$.

For the functions of angles greater than 90°, use the relations given in §57.

Tables of proportional parts are provided in Tables IV which may be used in the interpolation of logarithmic values of the functions between 4° and 86°.

Example 1. Find log sin 21°13′26″.

Turn to the page having 21° at the top. In the row having 13 on the left, find in the column marked "L Sin" at the top log sin 21°13′ = 9.55858 −10. (The −10 portion of the characteristic is omitted in the table.) The tabular difference is 33 and is given in the column marked "*d*". In the table of proportional parts for 33, the correction for 20″ is 11.0 and for 6″ is 3.3. These two corrections must be added to the value of log sin 21°13′. Hence log sin 21°13′26″ = 9.55872 −10.

Example 2. Find log ctn 56°23′37″.

On the page having 56° at the bottom, and in the row having 23 on the right, find in the column marked "L Ctn" at the bottom, log cot 56° 23′ = 9.82270 −10. The tabular difference is 27 and is given in the column marked "*c.d.*" In the table of proportional parts for 27, we obtain 17 as the correction for 37″. Since the logarithmic value of the cotangent decreases as the angle increases from 0° to 90°, this correction for 37″ must be subtracted from log ctn 56°23′. Hence log ctn 56°23′37″ = 9.82253 −10.

Example 3. Find the acute angle A, if log tan A = 9.67341−10. The tabulated value of the logarithm of the tangent just smaller

than 9.67341−10 is 9.67327−10. This corresponds to 25°14′. The difference between 9.67341−10 and 9.67327−10 is 14 and the tabular difference to be used is 33. In the proportional parts table for 33, we find the largest value less than 14 is 11.0, which corresponds to 20″. The difference 14 − 11.0 = 3.0, which corresponds to 5″. Hence, 25″ is the approximate correction and A = 25°14′25″.

Example 4. Find the acute angle A, if log cos A = 9.89317 − 10.

The value of the logarithm of the cosine decreases as the angle increases from 0° to 90°. Hence we must find in the column marked "L Cos" a value just larger than 9.89317 − 10. This value is 9.89324 −10 and corresponds to 38°33′. The difference between 9.89324 −10 and 9.89317 − 10 is 7, and the tabular difference is 10. From the table of proportional parts we see that the largest value just smaller than 7 is 6.7, which corresponds to 40″. The difference 7 − 6.7 = 0.3, which corresponds to 2″. Hence the correction is 42″, approximately. Therefore A = 38°33′42″.

Example 5. Find log sin 0°35′30″.

Convert 35′30″ to minutes. In table IVa, column A, we find for 35.5 minutes, S = 6.46372−10. By Table I, log 35.5 = 1.55023. Hence, log sin 0°35′30″ = log 35.5 + S

= 1.55023 + 6.46372 − 10 = 8.01395 − 10.

Table V. Natural Trigonometric Functions. This table gives the values of the sine, cosine, tangent, and cotangent at intervals of one minute from 0° to 90°. The method of interpolation is similar to that given in the explanation of Table IV.

The following tables are self-explanatory: Table VI. Decimal Equivalents of Common Fractions.—Table VII. Minutes and Seconds to Decimal Parts of a Degree.—Table VIII. Natural Trigonometric Functions for Decimal Fractions to a Degree.—Table IX. Common Logarithms of Functions in Radian Measure.—Table X. Degrees, Minutes, and Seconds to Radians.—Table XI. Natural Trigonometric Functions in Radian Measure.—Table XII. Radians to Degrees, Minutes and Seconds.—Table XIII. Table of Powers and Roots. The square, cube, square root, and cube root of n are given for each integer n from 1 to 999.—Table XIIIa. This table gives 1000 times the reciprocal of n; the circumference and area of a circle of diameter n, for n = 1 to 999.

Table XIV. Natural Logarithms. This table gives the logarithms of N to the Naperian base e ($= 2.71828\ldots$) for equidistant values of N from 0.00 to 10.09 and from 10 to 1109. For values of N greater than 1109, use the formula $\log_e 10N = \log_e N + \log_e 10 = \log_e N + 2.30258509$, or the formula $\log_e N = (\log_e 10)(\log_{10} N) = 2.30258509\ (\log_{10} N)$.

Table XV. Values and Logarithms of Exponential and Hyperbolic Functions. This table gives the values of e^x, e^{-x}, sinh x, cosh x, tanh x, and the common logarithms of e^x, sinh x, and cosh x for values of x equally spaced from 0.00 to 3.00 and for certain values of x from 3.00 to 10.00. The common logarithm of e^{-x} may be found by the relation $\log_{10} e^{-x} = -\log_{10} e^x = \operatorname{colog} x$. To find $\log_{10} \tanh x$, use $\log_{10} \tanh x = \log_{10} \sinh x - \log_{10} \cosh x$. This table may be extended indefinitely by means of Table XVI, since $\log_{10} e^x = M \cdot x$.

Table XVI. Multiples of M and 1/M. The purpose of this table is to facilitate the multiplication of a number N by M and $1/M$. This occurs whenever it is desired to change from common logarithms to natural logarithms, and conversely. Thus

$$\log_{10} x = (\log_e x)(\log_{10} e) = M \cdot \log_e x; \log_e x = \log_{10} x/M.$$

These multiples are also required in

$$\log_{10} e^x = Mx,\ \log_e (10^n \cdot x) = \log_e x + n(1/M),$$

and in the approximate formulae

$$\log_{10} (1 \pm x) = \pm x \cdot M \text{ and } 10^{\pm x} = 1 \pm (1/M)x.$$

The following tables are self-explanatory: Table XVII. Logarithms of Primes.—Table XVIII. Common Logarithms of Gamma Functions.—Table XIX. Compound Interest (See §19).—Table XX. Compound Discount (See §20).—Table XXI. Amount of an Annuity (See §23).—Table XXII. Present Value of an Annuity (See §24).—Table XXIII. Logarithms for Interest Computations.—Table XXIV. American Experience Mortality Table.—Table XXV. Logarithms of Factorial n.—Table XXVa. Binomial Coefficients.—Table XXVb. Probability Functions.—Table XXVc. Factors for Computing Probable Errors.—Table XXVI. Complete Elliptic Integral.—Table XXVII. Four-place Common Logarithms of Trigonometric Functions.—Table XXVIII. Four-place Natural Trigonometric Functions.—Table XXIX. Four-place Common Logarithms of Numbers.—Table XXX. Four-place Common Anti-logarithms of Numbers.

Table IV

COMMON LOGARITHMS OF THE TRIGONOMETRIC FUNCTIONS FROM 0° TO 90°

At Intervals Of One Minute
To Five Decimal Places

Table IVa

AUXILIARY TABLE OF S AND T FOR A IN MINUTES

$S = \log \sin A - \log A'$ and $T = \log \tan A - \log A'$
A' = number of minutes in A, and $(90° - A)'$ = number of minutes in $90° - A$.

A'	S

Interpolation

Let $f(x)$ be an analytic function of x. If the values of $f(x)$ are given in a table for a set of values of x separated from one another consecutively by the constant small interval h, the differences between the successive values of the function as tabulated are called *first tabular differences*, the differences of these first differences, *second tabular differences*, etc. The first, second and third tabular differences corresponding to $x = a$ and the tabulated value of $f(a)$ are:

$\Delta_1 \equiv f(a+h) - f(a),$

$\Delta_2 \equiv f(a+2h) - 2 \cdot f(a+h) + f(a),$

$\Delta_3 \equiv f(a+3h) - 3 \cdot f(a+2h) + 3 \cdot f(a+h) - f(a).$

The value of $f(x)$ for $x = a+\delta$, where $\delta = kh$, $0<k<1$, is:

$$f(a+\delta) = f(a) + k \cdot \Delta_1 + \frac{k(k-1)}{2!} \cdot \Delta_2 + \frac{k(k-1)(k-2)}{3!} \cdot \Delta_3 + \cdots.$$

The amount A of principal P at compound interest after n years is: $A = P(1 + r)^n$.
The present value P of an amount A due at end of n years is: $P = A/(1 + r)^n$.

$${}_nC_m = \binom{n}{m} = \frac{n!}{[(n-m)!\,m!]} = \binom{n}{n-m}, \binom{n}{0} = 1.$$

$$(p+q)^n = p^n + \binom{n}{1} p^{n-1}q + \ldots + \binom{n}{s} p^s q^t + \ldots + q^n, \; s + t = n.$$

PROBABILITY

Let p = probability of an event e in one trial, and q = probability of failure of e. The probability that, in n trials, the event e will occur exactly $(n-t)$ times is $\binom{n}{t} p^{n-t} q^t$. The probability that an event e will happen at least r times in n trials is $\sum_{t=0}^{t=n-r} \binom{n}{t} p^{n-t} q^t$; at most r times in n trials is $\sum_{t=n-r}^{t=n} \binom{n}{t} p^{n-t} q^t$.

In a *point binomial*, $(p+q)^n$, distribution, the mean number of favorable events is np; the mean number of unfavorable events is nq; the *standard deviation* is $\sigma = \sqrt{pqn}$; and $a_3 = (p-q)/\sigma$. The *mean deviation from the mean* $= MD$ is $\sigma\sqrt{2/\pi} = 0.7979\,\sigma$; the *semi-quartile deviation from the mean* $= 0.6745\,\sigma = 0.845\,MD$.

The probability that a deviation of an individual measure from the average lies between $y = -a$ and $y = a$ is

$$\frac{1}{\sqrt{\pi}} \int_{y=-a}^{y=a} h e^{-h^2y^2} dy = \frac{1}{\sigma\sqrt{2\pi}} \int_{y=-a}^{y=a} e^{-\frac{y^2}{2\sigma^2}} dy = \frac{1}{\sqrt{2\pi}} \int_{x=-b}^{x=b} e^{-\frac{x^2}{2}} dx,$$

where $x = hy\sqrt{2}$, $b = ha\sqrt{2}$, and $\sigma = 1/h\sqrt{2}$; h is called the *modulus of precision* and σ the *standard (quadratic mean) deviation.*

Table XXV b

PROBABILITY FUNCTIONS

$$\tfrac{1}{2}(1+\alpha) = \int_{-\infty}^{x} \Phi(x)\,dx = \text{Area under } \Phi(x) \text{ from } -\infty \text{ to } x,$$

$$\alpha = \int_{-x}^{x} \Phi(x)dx, \qquad \Phi(x) = \frac{1}{\sqrt{2\pi}} e^{\frac{-x^2}{2}} = \text{Normal function.}$$

$\Phi^{(2)}(x) = (x^2-1)\ \Phi(x)$ = Second derivative of $\Phi(x)$.
$\Phi^{(3)}(x) = (3x-x^3)\ \Phi(x)$ = Third derivative of $\Phi(x)$.
$\Phi^{(4)}(x) = (x^4-6x^2+3)\ \Phi(x)$ = Fourth derivative of $\Phi(x)$.

The sum of those terms of $(p+q)^n \equiv \sum_{t=0}^{n} \binom{n}{t} p^{n-t} q^t$, $p+q=1$, in which t ranges from a to b, inclusive, a and b being integers, $(a \leqq t \leqq b)$, is (if n is large enough) approximately

$$\int_{x_1}^{x_2} \phi(x)\,dx + \left[\frac{q-p}{6\sigma}\phi^{(2)}(x) + \frac{1}{24}\left(\frac{1}{\sigma^2} - \frac{6}{n}\right)\phi^{(3)}(x)\right]_{x_1}^{x_2},$$

where $x_1 = (a - \frac{1}{2} - qn)/\sigma$, $x_2 = (b + \frac{1}{2} - qn)/\sigma$.

The sum of the first $(t+1)$ terms of

$(p+q)^n \equiv \sum_{t=0}^{n} \binom{n}{t} p^{n-t} q^t$, $p+q=1$, is approximately,

$$\int_x^\infty \phi(x)\,dx + \frac{q-p}{6\sigma}\,\phi^{(2)}(x) - \frac{1}{24}\left(\frac{1}{\sigma^2} - \frac{6}{n}\right)\phi^{(3)}(x),$$

where $x = (s - \frac{1}{2} - np)/\sigma$, $s = n - t$. The sum of the last $(s+1)$ terms is approximately

$$\int_x^\infty \phi(x)\,dx - \frac{q-p}{6\sigma}\,\phi^{(2)}(x) - \frac{1}{24}\left(\frac{1}{\sigma^2} - \frac{6}{n}\right)\phi^{(2)}(x),$$

where $x = (t - \frac{1}{2} - nq)/\sigma$.

The *probable error* of a single observation in a series of n measures, $t_1, t_2, \ldots, t_n$, the arithmetic mean of which is m, is

$$e = \frac{0.6745}{\sqrt{n-1}}\sqrt{(m-t_1)^2 + (m-t_2)^2 + \ldots + (m-t_n)^2};$$

the probable error of the mean is

$$E = \frac{0.6745}{\sqrt{n(n-1)}}\sqrt{(m-t_1)^2 + (m-t_2)^2 + \ldots + (m-t_n)^2}.$$

Approximate values of e and E are

$$e = 0.8453 \frac{\sum_{i=1}^{n} d_i}{\sqrt{n(n-1)}}, \quad E = 0.8453 \frac{\sum_{i=1}^{n} d_i}{n\sqrt{n-1}},$$

where $\sum_{i=1}^{n} d_i$ is the sum of the deviations $d_i = |t_i - m|$.

Table XXVI

COMPLETE ELLIPTIC INTEGRALS, K AND E, FOR DIFFERENT VALUES OF THE MODULUS, k

$$K = \int_0^{\frac{\pi}{2}} \frac{dx}{\sqrt{1-k^2\sin^2 x}}; \quad E = \int_0^{\frac{\pi}{2}} \sqrt{1-k^2\sin^2 x} \cdot dx$$

Mathematical Symbols and Abbreviations

$+$	Plus or Positive
$-$	Minus or Negative
$\pm$	Plus or minus Positive or negative
$\mp$	Minus or plus Negative or positive
$\times$ or $\cdot$	Multiplied by
$\div$ or $:$	Divided by
$=$ or $::$	Equals, as
$\neq$, $\doteq$	Does not equal
$\fallingdotseq$	Equals approximately Congruent
$>$	Greater than
$<$	Less than
$\geqq$	Greater than or equal to
$\leqq$	Less than or equal to
$\backsim$	Similar to
$\therefore$	Therefore
$\sqrt{\ }$	Square root
$\sqrt[n]{\ }$	nth root
a^n	nth power of a
log or $\log_{10}$	Common logarithm Briggsian "
ln or $\log_e$ or log	Natural logarithm Hyperbolic " Napierian "
e or ϵ	Base (2.718) of natural system of logarithms
π	Pi (3.1416)
$\angle$	Angle
$\perp$	Perpendicular to
$\parallel$	Parallel to
a°	a degrees (angle)
a'	a minutes (angle) a prime
a''	a seconds (angle) a second a double-prime
a'''	a third a triple-prime
a_n	a sub n
sin	Sine
cos	Cosine
tan	Tangent
cot or ctn	Cotangent
sec	Secant
csc	Cosecant
vers	Versed sine
covers	Coversed sine
exsec	Exsecant
$\sin^{-1}a$ or arc sin a	Anti-sine a Angle whose sine is a Inverse sine a
sinh	Hyperbolic sine
cosh	Hyperbolic cosine
tanh	Hyperbolic tangent
$\sinh^{-1}a$ or arc sinh a	Anti-hyperbolic sine a Angle whose hyperbolic sine is a
$P(x,y)$	Rect. coörd. of point P
$P(r, \theta)$	Polar coörd. of point P
$f(x), F(x)$ or $\Phi(x)$	Function of x
Δy	Increment of y
$\doteq$ or $\rightarrow$	Approaches as a limit
Σ	Summation of
∞	Infinity
dy	Differential of y
$\frac{dy}{dx}$ or $f'(x)$	Derivative of $y=f(x)$ with respect to x
$\frac{d^2y}{dx^2}$ or $f''(x)$	Second deriv. of $y=f(x)$ with respect to x
$\frac{d^ny}{dx^n}$ or $f^{(n)}(x)$	nth deriv. of $y = f(x)$ with respect to x
$\frac{\partial z}{\partial x}$	Partial derivative of z with respect to x
$\frac{\partial^2 z}{\partial x\,\partial y}$	Second partial deriv. of z with respect to y and x
$\int$	Integral of
$\int_a^b$	Integral between the limits a and b
j or i	Imaginary quantity $(\sqrt{-1})$, $i^2=-1$
$x=a+jb$	Symbolic vector notation
$n!=1\cdot2\cdot3\cdots n$	

Greek Alphabet

A	α	Alpha	N	ν	Nu
B	β	Beta	Ξ	ξ	Xi
Γ	γ	Gamma	O	o	Omicron
Δ	δ	Delta	Π	π	Pi
E	ϵ	Epsilon	P	ρ	Rho
Z	ζ	Zeta	Σ	σ	Sigma
H	η	Eta	T	τ	Tau
Θ	θ	Theta	Y	υ	Upsilon
I	ι	Iota	Φ	ϕ	Phi
K	κ	Kappa	X	χ	Chi
Λ	λ	Lambda	Ψ	ψ	Psi
M	μ	Mu	Ω	ω	Omega

Abbreviations, mathematical, *M 270*
Absolute humidity, 1406-7
" density of water at various temperatures, 1378
" viscosity, definition of, 1583
" viscosity, relation to specific viscosity, 1591
" zero, definition, 1639
Absorption coefficients for X-rays, 1057-60
" , DeMent's law, definition, 1656
" , heat of, definition, 1639
" of water by plastics, 699
Absorptivity, dimensional formula, 1710
Abundance of isotopes, 87-92
" of minerals, 102-47
Acceleration, dimensional formula, 1710
" of gravity, probable value of, 1714
" of gravity at various stations, 1615-22
" units and conversion factors, 1716-51
Accidents, first aid measures, 1-2
Aceta, definition of, 1663
Acetic acid, density of aqueous solutions, 1270-1
Acetyl number, definition, 1639
" " of fats, oils and waxes, 678-85
Acetylene, definition, 1639
" , poisoning, treatment of, 4
" , solubility in water at various temperatures, 1256
Acid-base indicators, 1119-23
Acid burns, treatment of, 1
" , definition of, 1639
" number, definition, 1639
" number of fats, oils and waxes, 678-85
" number of insoluble fatty acids, 680-5
" number of resins, 686-94
" proof, black stain for wood, 1696
" resistance of plastics, 700-2
" resistant cements, properties of, 800-1
Acidic azeotropes, 1393
Acids, analysis, outline for, 1127-9
" , standard solutions for volumetric analysis, 1174-5
" and ammonia, concentrations of commercial solutions, 1164
" and bases, ionization constants of, 1396-9
" , fatty, constants of, 680-5
" , poisoning, treatment of, 2
" , qualitative tests for, 1124-63
" , refractive index of aqueous solutions, 1036
Acidimetry, primary standards for volumetric, 1201
Action, dimensional formula, 1710
" units and conversion factors, 1716-51
Active mass, definition of, 1639
Activity coefficient, definition of, 1639
Additive property, definition of, 1639
Adiabatic process, definition of, 1639
Adsorption, definition of, 1639
" , Gibb's equation for liquids, 1634
" , of gases, equation for, 1633
Advance resistance wire, properties of, 842
Aid in accidents and poisonings, 1
Air, buoyancy reduction factor for weighings in air, 1754
" , buoyancy reduction for specific gravity to in vacuo, 1267
Air, density at various temperatures, 1476
" , solubility in water at various temperatures, 1256
" , weights to in vacuo, conversions, 1754
Alberene desk top dressing, 1696
Albumen, density of aqueous solutions, 1272
Alcohol, conversion of percentage, 1374
" , definition of, 1639
" , denatured, formulas for, 1697-1704
" , density at various temperatures, 1369
" , ethyl, refractive index, 1038-43; 1373-4
" , ethyl, specific gravity of aqueous solutions, 1360-9
" , methyl, refractive index, 1373-4
" , methyl, specific gravity of aqueous solutions, 1370-3
" , refractive index of aqueous solutions, 1038-43; 1373-4
Alcoholic azeotropes, 1389; 1395
Alcohols, poisoning, treatment of, 2
Alcohol-water freezing point, 1380
Aldehyde, definition of, 1639
Aldehydes, poisoning, treatment of, 3
Algae, chemicals for treatment of, 748-50
" , preservative, 1696
Algebra, *M 1*
Alicyclic, definition of, 1639
Aliments, definition of, 1663
Alkali burns, treatment of, 1
" , definition of, 1640
" group, analysis of, 1126-7
" resistance of plastics, 700-2
Alkalimetry, primary standards for volumetric, 1201
Alkaline earth group, analysis of, 1126
Alkalinity, definition of, 1640
" of water, 739
Alkalis, standard solutions for volumetric analysis, 1174-5
Alkaloid, definition of, 1640
Alkaloids, poisoning, treatment of, 3
" , physical constants of, 654-69
" , reagents for detection of, 1165-72
Allowable carrying capacities of copper wire, 843
Alloy, definition of, 1640
Alloys and metals, heat conductivity of various, 1518-9
" , composition and physical properties, 766-87
" , etching solutions for, 788-91
Alpha particle, mass of, probable value of, 1715
" particle, specific charge of, probable value of, 1715
" radiation, definition of, 1640
Alteratives, definitions of, 1663
Altitude, determination by formula, 1606
" of various stations, 1615-22
Alum, potassium chrome, density of aqueous solutions, 1311
Aluminum chloride, density of aqueous solutions, 1272-3
" group, analysis of, 1125-6
" nitrate, specific gravity of aqueous solutions, 1351
" sulfate, density of aqueous solutions, 1273-4
" weights, density of, 1754
Ammonia and acids, concentration of commercial solutions, 1164
" , density of aqueous solutions, 1274-5

INDEX

Ammonia, entropy of, 1442
" , latent heat of evaporation, 1442
" , poisoning, treatment of, 3
" , physiological response to, 1672
" , solubility in water at various temperatures, 1256
" for refrigeration, 1383
" , specific volume at various temperatures, 1442
" , vapor pressure at various temperatures, 1441-2
Ammonium acetate, specific gravity of aqueous solutions, 1357
" bromide, specific gravity of aqueous solutions, 1356
" carbonate, specific gravity of aqueous solutions, 1357
" chloride, density of aqueous solutions, 1276
" fluoride, specific gravity of aqueous solutions, 1357
" hydroxide, density of aqueous solutions, 1274-5
" iodide, specific gravity of aqueous solutions, 1357
" nitrate, density of aqueous solutions, 1276-7
" sulfate, density of aqueous solutions, 1278-9
Amount at compound interest, formula, *M 6-7*
" at compound interest, table, *M 250*
Ampere, definition of, 1640
" , international, probable value of, 1713
Amplitude, *M 30*
Ampullae, definition of, 1663
Analgesics, definition of, 1663
Analysis of alcohol mixtures with immersion refractometer, 1373-4
" of coal, 754-6
" of coal, heat value calculation from, 756
" , inorganic, organic reagents for, 1131-63
" , mineralogical, heavy liquids for, 153
" , qualitative, outline for, 1127-9
" , qualitative spectrographic, 1069
" , standard solutions for volumetric, 1174-5
" , volumetric, equations and equivalents for, 1179-94
" of water, 739-51
Analytic geometry, plane, *M 25*
" geometry, solid, *M 33*
Analytical reagents, organic, 1131-63
" reagents, various solutions, 1165-72; 1174-5
Anaphrodisiacs, definition of, 1663
Anesthetics, definition of, 1663
Angle, *M 15*
" , between two lines, *M 26; 34*
" , between two curves, *M 39*
" , between two planes, *M 35*
" , units and conversion factors, 1716-51
Angstrom unit, definition of, 1640
Anhydrotic, definition of, 1664
Anhydrous, definition of, 1640
Aniline, poisoning, treatment of, 3
Animal and plant sources of fats, oils and waxes, 678-85
" and plant sources of vitamins, 730-3
" oil, definition of, 1640
Anion, definition of, 1640
Annuity, amount of, *M 6*
" , amount of, table, *M 252*
Annuity, present value of, *M 7*
" , present value of, table, *M 253*
Annulus, area of, *M 15*
Anode, definition of, 1640
Anodyne, definition of, 1664
Anthelmintic, definition of, 1664
Antidotes of poisons, 2-5
Antiemetic, definition of, 1664
Anti-freeze solutions, composition of, 1380-2
Antihydrotic, definition of, 1664
Anti-hyperbolic functions, *M 24*
Antilithic, definition of, 1664
Anti-logarithms, *M 2; 99*
" " , four-place tables, *M 268*
Antimonial, definition of, 1664
Antimony electrode, 1117-8
" , poisoning, treatment of, 3
Antiperiodic, definition of, 1664
Antiphlogistic, definition of, 1664
Antipyretic, definition of, 1664
Antiscorbutic, definition of, 1664
Antiseptic, definition of, 1664
" , phenol coefficients of, 1673
Antispasmotic, definition of, 1664
Antitoxin, definition of, 1664
Anti-trigonometric functions, *M 19*
Antivenin, definition of, 1664
Antizymotic, definition of, 1664
Aperient, definition of, 1664
Aphrodisiac, definition of, 1664
A.P.I. scale conversion to Baume, table, 1768-9
Apothecary units and conversion factors, 1671; 1716-51
Appearance of alkaloids, 654-69
" of glucosides, 670-7
" of inorganic compounds, 154-265
" of minerals, 102-47
" of organic compounds, 314-653
" of resins, 686-94
Approximation to area, *M 13*
Aquae, definition of, 1664
Aqueous alcohol solutions, specific gravity of, 1360-9
" azeotropes, 1386; 1395
" methyl alcohol solutions, specific gravity of, 1370-3
" solutions, coefficients of compressibility of, 1596-1600
" solutions, coefficients of cubical expansion of, 1601-3
" solutions, density of, 1270-1373
" solutions, electrical conductivity of, 1399-1403
" solutions, specific gravity of, 1270-1373
" solutions, specific viscosity of, 1591-5
" solutions, surface tensions of, 1578-81
" solutions, weight of, 1270-1373
" tension, definition of, 1640
" tension of pure water at various temperatures, 1443-9
" tension of various solutions, 1756-7
Arbitrary constants, *M 47*
Arc length, *M 12-3; 41; 52*
Archimedian spiral, *M 33*
Area, dimensional formula, 1710
" by approximation, *M 13*
" of circles, table, *M 206*
" units and conversion factors, 1716-51
Areas, *M 11-4; 22; 26; 31; 52-3*
" by integration, *M 52-4*
Arithmetic mean, *M 3*
" progression, *M 3*
Aromatic, definition of, 1664

INDEX

Arrhenius equation for rate of reaction, 1638
Arsenic acid, density of aqueous solutions, 1279-80
" , poisoning, treatment of, 3
Arsenical, definition of, 1664
Arsine, poisoning, treatment of, 3
Arts and recipes for the laboratory, 1689-96
Asbestos, chemical resistance of, 792-5
" fiber, physical properties of, 798
Ash in food, 722-9
" in wood, 752-3
Association of liquids, equation for, 1634
Astringent, definition of, 1664
Asymtotes, *M 29*
Athermanous, definition of, 1640
Atmosphere, probable value of, 1713
Atom, definition of, 1640
" , hydrogen, mass of, probable value of, 1715
" , mass of, of unit atomic weight, probable value of, 1715
Atomic boiling point numbers, 853
" numbers, 6-7; 54-5; 87-92
" number, definition of, 1640
" radius, definition of, 1640
" theory, definition of, 1641
" weight, definition of, 1641
" weights, probable value of, 1713
" weights, table (see also inside of back cover), 6-7
" weights, changes from 1894-1941, 83-6
" weight of electron, probable value of, 1714
" weights of isotopes, 87-92
Atoms, effective radii of, 92-3
Autoignition temperatures of flammable substances, 34-51
Average life, definition of, 1641
Avogadro's hypothesis, definition of, 1641
" number, definition of, 1641
" number, probable value of, 1713
Avoirdupois, units and conversion factors, 1716-51
AWG gage of wire, 844
Azeotropic mixtures, 1386

B

B and S gage of wire, 840
Babinet's formula for determination of altitude, 1606
Bacteriological quality of water, 750
Balancing equations, method for, 1178
Ball mill speeds, 868

Denatured alcohol, formulas, properties and uses, 1697-1709
Densities of liquids, 932-1026
" and volumes, orthobaric, of various substances, 1462-75
Density, see also specific gravity, ...
" , *M 54*
" , conversion to specific gravity, 1268
" , definition of, 1644
" , dimensional formula, 1710
" , vapor, definition of, 1661
" , vapor, of flammable substances, 34
" of air at various temperatures, 1476
" of alcohol-water solutions, 1360-9
" of calcite, probable value of, 1714
" of denatured alcohol, 1696-1704
" of the earth, average, probable value of, 1714
" of elements, 94-9; 154-265
" of gases, critical, 1492-4
" of inorganic compounds, 154-265
" of heavy liquids, 153
" of various liquids (approximate), 1374-5
" of mercury, probable value of, 1714
" of mercury, at various temperatures, 1376-7
" of methyl alcohol-water solutions, 1370-3
" of organic compounds, 314-653
" of oxygen, probable value of, 1714
" of refrigerants, 1383
" of synthetic rubbers, 697
" of various solids and liquids (approximate), 1374-5
" of solutions, aqueous, 1270-1373
" of steam, 1452-61
" of water, maximum, probable value of, 1714
" of water, at various temperatures, 1376-8
" of various weights, 1754
" of various woods for pattern making, 775
" units and conversion factors, 1716-51
" units and hydrometers, 1265-6
Dental anodyne, definition of, 1666
Dentifricia, definition of, 1666
Deodorant, definition of, 1666
Depression of freezing point, equation for, 1635
" of freezing point, molecular, 1385
" of freezing point, molecular, definition, 1644
" of vapor pressure, equation for, 1635
" of vapor pressure, molecular, 1385
Depresso-motor, definition of, 1666
Derivation of names of elements, 56-82
Derivative, *M 37; 96*
" , partial, *M 46*
" , total, *M 46*
Derivatives, table of, *M 37-9*
Descartes' rule, *M 10*
Desensitizer for photography, 1679
Desiccator lid lubricant, 1694
Desk top dressing, 1696
Detection of acidic constituents, 1127-9
Determinants, *M 4*
Determination of hydrogen ion concentration, 1097-1123
Deuterium, Rydberg constant, probable value of, 1714
Developers for photography, 1674
Dew point, definition of, 1644
" point tables, 1406-7
Dextrorotatory, definition of, 1644
Dextrose, cuprous oxide and copper equivalent of, 1224-39
Diamagnetic, definition of, 1644
Diaphoretic, definition of, 1666
Diathermanous, definition of, 1644
Dichlorodifluoromethane for refrigeration, 1383
Dichloromonofluoromethane for refrigeration, 1383
Dichlorotetrafluoroethane for refrigeration, 1383
Dielectric, definition of, 1644
" constant, definition of, 1644
" constant, dimensional formula, 1710
" constants of materials of construction, 796-8
" constants of synthetic rubbers, 696
" strength of plastics, 699
Dietary standards, 722-3
Differential calculus, *M 37*
" , definition of, *M 40*
Differentiation of vectors, *M 96*
Diffusion coefficient, definition, 1644
" coefficient, dimensional formula, 1710
" of gas and water through synthetic rubber, 698
Digestive acid, definition of, 1666
" ferment, definition of, 1666
Dilute solution, definition of, 1644
Dilution, acids and ammonia to normal solutions 1164
" , heat of, definition, 1644
" , Pearson's square method, 735
" table, 1264
Dimension of wire, AWG gage, 844
" of wire, B and S gage, 840
Dimensional formulas, 1710-2
DIN speed, comparison with other ratings, 1684
Diolefin, definition of, 1644
Direction of cosines, *M 34*
Directrix, *M 28*
Discharge coefficient, 836-9
Discount, *M 6; 251*
Discovery of elements, 56-82
Discutient, definition of, 1666
Disinfectant, definition of, 1666
" , phenol coefficients of, 1673
Dispersion in refraction, 883
Displacement series of metals, 1094
Dissociation constants of acids and bases, 1396-9
" , definition of, 1644
" , electrolytic, definition of, 1645
" , heat of, definition of, 1644
" , of gases, equations for, 1633
Distance between points, *M 25; 34*
Distillation, definition of, 1645
Distribution coefficient, definition of, 1645
" of minerals, 102-47
Diuretic, definition of, 1666
Divergence, *M 96*
Division of a line segment, *M 26*

Page numbers preceded by M and in italics refer to pages in the mathematical appendix.

INDEX

Dodecahedron, *M 14*
Double fluid cells, composition and E.M.F. of, 1095-6
Drinking water standards, 750
Dry and wet bulb readings for hygrometry, 1406-13
Dry measure, units and conversion factors, 1716-51
Drying oil, definition of, 1645
Dulong and Petit's law, definition of, 1645
Durand's rule, *M 13*
Dyes for sensitizing photographic plates, 1684
Dyestuff intermediates, names and formulas of, 703-20

E

e, definition of, *M 38*
Earth, average density of, probable value of, 1714
" , rare, definition of, 1657
Ecbolic, definition of, 1666
Eccentricity, *M 28-9*
Effective rate, *M 6*
" size, definition of, 876
Efflorescence, definition of, 1645
Effusion, law of, 1648
" of gases, equations for, 1632-3
Einstein photochemical equivalence law, definition, 1656
Elasticity, modulus of, definition, 1653
" , modulus of, of plastics, 699
Electrical cell, definition of, 1642
" conductivity of solutions and liquids, 1399-1405
" equivalent of heat, probable value of, 1713; 1714
" inductivity, dimensional formula, 1710
" polarity, indicators for, 1696
" properties of plastics, 802-5
" properties of synthetic rubbers, 696
" properties of solutions, equations for, 1635-6
" properties of wire, 840-4
" resistivity of elements, 94-9
" , resistivity of plastics, 699
" units and conversion factors, 1716-51
Electrochemical equivalent, definition of, 1645
" equivalent of iodine, probable value of, 1714
" equivalent of silver, probable value of, 1714
Electrode, definition of, 1645
" potential, definition of, 1645
" potentials, 1093-4
" potentials for quinhydrone, 1104
Electrodes, calomel, hydrogen, quinhydrone, antimony, etc., 1097-1123
Electroluminescence, definition of, 1645
Electrolysis, definition of, 1645
" , hydrogen, charge in one gram, probable value of, 1714
Electrolyte, definition of, 1645
Electrolytic dissociation theory, definition of, 1645
Electromagnetic system, units, 1710
Electrometric determination of hydrogen ion concentration, 1097-1123
Electromotive force (E.M.F.), definition of, 1645
" force, equations for, 1638
" force of voltaic cells, 1095-6
" series of metals, 1094
Electron, definition of, 1645
" , atomic weight, probable value of, 1714
" , mass of, probable value of, 1715
" theory, definition of, 1645
Electronic charge, probable value of, 1713
" charge, specific, probable value of 1713
Electrostatic system, units, 1710
Elements, relative abundance of, 56-82
" , atomic numbers and weight (see also inside back cover), 6-7; 83-92
" , crystalline form of, 94-9; 154-265
" , description of, 56-82
" in foods, 722-3
" , French names for, 56-82
" , fusion, latent heat of, 94-9; 1525-6
" , German names for, 56-82
" , isotopes of, 87-92
" , average and half life of radioactive, 100-1
" , mass numbers of, 87-92
" , melting and boiling points of, 94-9; 154-265
" , occurrence of, 56-82
" , periodic arrangement of, 52-5
" , physical constants of, 94-9; 154-265
" , prices of, 56-82
" , qualitative tests for, 1124-63
" , radioactive, 100-1
" , specific heat of, 1495-1517
" , spectra of, 1069-92
" , surface tension of, 94-9; 1573-4
" , symbols, atomic weights and numbers, valence of, 6-7; 54-5
" , synonyms of, 86
" , thermal expansion of, 94-9; 1603
" , vaporization, latent heat of, 94-9; 1531-5
Elementary geometry, *M 11*
Elevation of boiling point, equation for, 1635
" of boiling point, molal, definition, 1641
" of boiling point, molecular, 1385
Elixira, definition of, 1666
Ellipse, *M 13; 28*
Ellipsoid, *M 15; 35*
Elliptic integrals, values of complete, *M 263*
Elongation, definition of, 1646
" of cast metals, 774-5
" of synthetic rubber, 697
Emergent stem correction for thermometers, 849
Emetic, definition of, 1666
E.M.F., definition of, 1645
" , equations for, 1638
" of voltaic cells, 1095-6
Emmenagogue, definition of, 1666
Emollient, definition of, 1666
Emplastra, definition of, 1666
Emulsa, definition of, 1667
Emulsion, definition of, 1646
" , photographic, 1685-8
Enamels, chemical resistance of, 792-5
Enameled steel, physical properties of, 796
End point, definition of, 1646
End points and intervals of pyrometric cones, 858-61
Enemata, definition of, 1667
Energy, dimensional formula, 1710
" , free, definition of, 1647
" , free, of compounds, 1568-73
" , kinetic, definition of, 1651
" , molecular surface, equation for, 1634

INDEX

Energy, potential, definition of, 1656
" in calories per mole for one abs-volt-electron per mole, probable value of, 1715
" in ergs of one abs-volt-electron, probable value of, 1714
" units and conversion factors, 1716-51
Engler viscosity, conversion to other scales, 1771
English units and conversion factors, 1716-51
Entropy, definition of, 1646
" of ammonia, 1442
" of steam, 1452-61
Enzyme, definition of, 1646
Eotvos constant, equation for, 1634
Epicycloid, *M 32*
Epispastic, definition of, 1667
Equation of circle, *M 27*
" of ellipse, *M 28*
" of hyperbola, *M 29*
" of locus, *M 26*
" of nth degree, *M 9*
" of normal, *M 39*
" of parabola, *M 28*
" of straight line, *M 27; 35*
" of tangent, *M 39; 47*
" , thermochemical, definition of, 1660
Equations and equivalents for volumetric analysis, 1179-94
" , method for balancing, 1178
" , physical chemistry, 1632-8
" , solution of, *M 7; 20*
Equilibrium, definition of, 1646
" constant, equation for, 1637
" constant of acids and bases, 1396-9
Equivalent conductance of ions, 1399
" , cuprous oxide and copper, of dextrose, invert sugar, lactose, levulose, and maltose, 1224-39
" , electrical, of heat, probable value of, 1713; 1714
" , electrochemical, definition of, 1645
" , electrochemical, of iodine, probable value of, 1714
" , electrochemical, of silver, probable value of, 1714
" , hydrogen, of salts and other reagents, 1176-7
" , mechanical, of heat, definition of, 1652
" , mechanical, of heat, probable value of, 1713; 1714
" weight, definition of, 1646
" weight, ceramic, 878-82
Equivalents and equations for volumetric analysis, 1179-94
Errhine, definition of, 1667
Esbach's reagent for estimation of proteins, 1167
Escharotic, definition of, 1667
Eschka's mixture for sulfur in coal, 1167
Essential oil, definition of, 1646
Ester, definition of, 1646
" number, definition of, 1647
" number of resins, 686-94
Etching solutions for alloys, 788-91
Ethane, solubility in water at various temperatures, 1257
Ethyl alcohol, conversion of percentages, 1374
" alcohol, refractometer readings of, 1038-43; 1373-4
" alcohol, specific gravity of aqueous solutions, 1360-9
Ethyl bromide, physiological response to, 1672
" chloride, physiological response to, 1672
" chloride, for refrigeration, 1383
Ethylene, poisoning, treatment of, 4
" , solubility in water at various temperatures, 1257
" glycol-water solutions, freezing point of, 1380
Ettinghausen effect coefficient, dimensional formula, 1710
Etymology of the names of the elements, 56-82
Eutectic temperatures of freezing mixtures, 1379
Excito-motor, definition of, 1667
Exfoliation, definition of, 1647
Expansion, coefficients of cubical, 1601-3
" , coefficients of linear, 1604
" , thermal, definition of, 1660
" , thermal, of alloys, 766-73
" , thermal, of elements, 94-9; 1603
" , thermal, of materials of construction, 796-805
" and factors, formulas, *M 2*
Expectorant, definition of, 1667
Explanation of mathematical tables, *M 97*
" of use of logarithms, *M 97*
Explosive, definition of, 1647
" limits of flammable substances, 34-51
Exponential curve, *M 30*
" functions, logarithms of, table, *M 240*
" series, *M 44-5*
Exponents, *M 1*
Extracta, definition of, 1667

F

"F 11, 21, 114" for refrigeration, 1383
Factor, definition of, 1647
" of proportionality, *M 3*
" for converting oxygen to an ideal gas, probable value of, 1714
Factors and expansions, formulas, *M 2*
" for conversion of various units, 1716-51
" for conversion of air weight to in vacuo, 1754
" , gravimetric, and their logarithms, 1202-23
" for interconverting Saybolt, Redwood and Engler viscosimeter readings, 1771
" for reducing gas volumes to standard conditions, 1756-7
" , volumetric, and their logarithms, 1195-1201
Factorial *n*, *M 2*
Fahrenheit to Centigrade temperature conversion table, 1759-67
Faraday constant, probable value of, 1713
Faraday's laws of electrolysis, definitions of, 1647
Fat, definition of, 1647
" content of foods, 722-9
Fats, oils and waxes, constants of, 678-85
Febrifuge, definition of, 1667
Fehling's solution for sugar estimation, 1167
Ferment, definition of, 1667
Ferric ammonium sulfate, specific gravity of aqueous solutions, 1353
" chloride, density of aqueous solutions, 1287-8
" nitrate, density of aqueous solutions, 1289-90

INDEX

Ferric sulfate, density of aqueous solutions, 1290-1
Ferrous ammonium sulfate, specific gravity of aqueous solutions, 1353
" sulfate, density of aqueous solutions, 1291
Fiber content of foods, 722-9
" , vulcanized, physical properties of, 797
Field intensity magnetic, dimensional formula, 1710
" strength electrical, dimensional formula, 1710
Film, photographic, 1685-8
Filter factors for photographic films, 1685-8
Filters, heat, 1696
" , X-ray, 1056
Fine structure constant, probable value of, 1715
Fire extinguishers for flammable substances, 34
" hazards from chemicals, 8-33
First aid for accidents, 1-5
Fish, killing dosage of copper sulfate for, 746
Five-place logarithms, *M 105*
Fixed carbon, definition of, 1647
" investment, *M 7*
" oil, definition of, 1647
" points for thermometer calibration, 847-9
Fixing solutions for photography, 1677
Flame temperatures, 757-60
" tests for elements, 1130
Flammability of plastics, 702
Flammable liquids, gases, and solids, 34-51
Flash point of flammable substances, 34-51
Flasks, glass, true capacity of, 1173
Flexural strength of plastics, 699
Flow measurement in pipes, 836-9
" units and conversion factors, 1716-51
" of water in cast iron pipe, 825-33
Fluid, definition of, 1647
Fluidextracta, definition of, 1667
Fluidity, dimensional formula, 1710
Fluorescence, 1061-8
" , definition of, 1647
" , laws of, 1655-6
Fluorinated compounds for refrigeration, 1383
Fluosilicic acid, density of aqueous solutions, 1297
Flux of induction, dimensional formula, 1710
" luminous, dimensional formula, 1710
Focus, *M 28; 29*
Folin's mixture for uric acid, 1167
Food, definition of, 1667
" , cold storage temperature for, 1384
" , composition and use of, 722-9
" , specific and latent heat of, 1384
Force, *M 56*
" , dimensional formula, 1710
" , electromotive (E.M.F.), definition of, 1645
" , electromotive (E.M.F.), equations, 1638
" units and conversion factors, 1716-51
Form, crystalline, definition of, 1643
" and color of alkaloids, 654-69
" and color of elements, 94-9; 154-265
" and color of glucosides, 670-7
" and color of inorganic compounds, 154-265
" and color of minerals, 102-47
" and color of organic compounds, 314-653
Formation, heat of, definition of, 1647
" , heat of, of organic and inorganic compounds, 1547-73
Formic acid, density of aqueous solutions, 1291-3
Formula index of organic compounds, 287-307
Formula index of organic liquids, 1027-35
" weight, definition of, 1647
" weights of elements, 154-265
" weights of inorganic compounds, 154-265
" weights of organic compounds, 314-653
Formulas, dimensional, 1710-2
" of alkaloids, 654-69
" of glucosides, 670-7
" of inorganic compounds, 154-265
" of organic compounds, 314-653
" of organic radicals, 282-6
" for calculating properties of ceramic materials, 869-75
" for denatured alcohol, 1696-1704
" and names of ceramic materials, 864-6
" and trade names of chemicals, 703-20
" and trade names of dyestuff intermediates, 703-20
Four-place anti-logarithms, table of, *M 268*
" " logarithms, table of, *M 266*
Fourier series, *M 93*
Fraction, mol, definition of, 1653
Fractions, decimal equivalents of, table of, *M 196*
" , partial, *M 57*
Fraunhofer designation of spectrum lines, 883
Free energy, definition of, 1647
" energy, equation for, 1637
" energy, and heats of formation of compounds, 1568-73
Freezing point, definition of, 1648
" point lowering, equation for, 1635
" point, molecular depression of, 1385
" point of aqueous anti-freeze solutions, 1380-2
" mixtures and cooling baths, 1379
Freon for refrigeration, 1383
Frequency, dimensional formula, 1711
Freundlich's isotherm, equations for, 1633
Friction, dimensional formula, 1711
Froehde's reagent for alkaloids and glucosides, 1167
Frustrum of pyramid or cone, *M 14*
Fuels, heat value of, 754-6; 762-5
Function, definition of, *M 37*
Functions of angles, *M 16*

Transverse axis, *M 29*
Trapezoid, *M 11*
Trapezoidal rule, *M 13*
Triangle, *M 11-2; 21-2; 26*
Triboluminescence, definition of, 1661
Trichloromonofluoromethane for refrigeration, 1383
Triclinic system, definition of, 1661
Trigonometric curves, *M 30*
" equations, *M 20*
" formulas, *M 16; 18-24*
" functions, *M 16*
" functions (natural), table of, *M 265*
" functions in a right-angled triangle, *M 21*
" functions in degrees, logarithms of, table of, *M 128; 264*
" functions in radians, logarithms of, table of, *M 202*
" functions, values of, for decimal fractions of a degree, table of, *M 198*
" functions in degrees, values of, table of, *M 174; 265*
" functions in radians, values of, table of, *M 204*
" identities, *M 18-24*
" series, *M 44-5*
Trigonometry, plane, *M 15*
" , spherical, *M 22*
Trochisci, definition of, 1670
Trouton's rule, equation for, 1635
Troy weight units and conversion factors, 1716-51
True capacity of glass vessels, 1173
" discount, *M 6*
Tungsten trioxide, specific gravity of aqueous solutions, 1359
Twaddell scale conversion to Baume, table of, 1768-9
Twist, dimensional formula, 1712
Three hundred year calendar, 1776-7

U

Uffelmann's reagent for lactic acid, 1172
Ultimate strength, definition of, 1661
Ultimate strength of alloys, 766-73
Unguenta, definition of, 1670
Uniaxial crystals, refractive index of, 887-93
Uniformity coefficient, definition of, 876
Unimolecular reaction, equation for, 1637-8
Units and conversion factors, 1716-51
Unsaponifiable, definition of, 1661
" matter in fats, oils and waxes, 680-5
Uranyl nitrate, specific gravity of aqueous solutions, 1359
Urine, composition of, 721
U. S. coins as substitutes for weights, 1755
U. S. system of weights and measures, conversion factors, 1716-51
Use of mathematical tables, *M 97*
Uses authorized for denatured alcohol, 1705-9

V

Vacuo, conversion of weight in air to, 1754
" , conversion of specific gravity in air to, 1267
Valence, definition of, 1661
" of elements, 6-7; 54-5
Values of e^x and e^{-x}, table of, *M 240*
" of physical constants, probable values, 1713-5
Van der Waals' constants for gases, 1485-8
" der Waals' equation, 1632
Van't Hoff isochore, definition of, 1661
" Hoff isochore, equation for, 1637
Vapor density, definition of, 1661
" density of flammable substances, 34-51
" density of various substances, 1462-75
" pressure, definition of, 1661
" pressure lowering, equation for, 1635
" pressure of aqueous solutions, 1756-7
" pressure of ammonia at various temperatures, 1441-2
" pressure of mercury at various temperatures, 1440-1
" pressure of liquids from Cox chart, 857
" pressure of solutions, equation for, 1635
" pressure of steam, 1452-61
" pressure of various substances, 1413-75
" pressure of water at various temperatures, 1443-9; 1452-61
Vapors, physiological response to various, 1672
" , heat conductivity of, 1522
" , specific heat of, 1488-91
" , viscosity of, 1588-91
Vaporization, heat of, definition of, 1661
" , heat of, equation for, 1635
" , latent heat of, definition of, 1651
" , heat of, of elements and compounds, 94-9; 1385; 1531-5
" , heat of, of refrigerating gases, 1383
Variation, *M 3*
Variations of functions, *M 17*
Varieties of synthetic rubbers, 695
Vector, *M 95*
" analysis, *M 95*
" product, *M 95*
Vegetable oil, definition of, 1662
Velocity, dimensional formula, 1712
" of light, probable value of, 1713
" units and conversion factors, 1716-51
Verdet's constant, dimensional formula, 1712
Vermicide, definition of, 1670
Vermifuge, definition of, 1670
Vesicant, definition of, 1671
Vina, definition of, 1671
Vinegar, definition of, 1671
Viscosimeter conversion table, 1771
" , glycerol for calibration of, 1595
Viscosity, definition of, 1662
" , dimensional formula, 1712
" , equations for, 1633
" units and conversion factors, 1716-51
" of aqueous glycerol solutions, 1595
" of various substances, 1583-95
Vitamin, definition of, 1662
" content of foods, 722-9
Vitamins, table of, 730-3
Volatile matter in coal, 754-6
Volt, definition of, 1662
" , international, probable value of, 1714
Voltage of galvanic cells, 1095-6
" -hydrogen ion concentration, chart of, 1098

Page numbers preceded by M and in italics refer to pages in the mathematical appendix.

INDEX

Voltaic cells, composition and E.M.F. of, 1095-6
Volatile acid, definition of, 1662
" matter in coal, definition of, 1662
" oil, definition of, 1662
Volume, critical, definition of, 1643
" , critical, equations for, 1632
" , dimensional formula, 1712
" , molecular, definition of, 1653
" of gases, equations for, 1632
" of a perfect (ideal) gas, probable value of, 1713
" of gas, factors for reduction to standard conditions, 1756-7
" percentage of alcohol, conversion to proof, 1374
" , specific, of steam, 1452-61
" units and conversion factors, 1716-51
Volumes, *M 13-5; 53-4*
" by integration, *M 53-4*
" and densities, orthobaric, of various substances, 1462-75
" of tanks and pipes, 1752
Volumetric, definition of, 1662
" analysis, equations and equivalents for, 1179-94
" factors and their logarithms, 1195-1201
" primary standards, 1201
" standard solutions, 1174-5
Von Kobell's scale of fusibility, 103

W

Wafer, definition of, 1671
Wagner's solution for phosphate rock analysis, 1172
Water absorption of plastics, 699
" analysis, 739-51
" , boiling point at various pressures, 1449-51
" , coefficients of cubical expansion, 1603
" , compressibility of, 1596
" , delivery of, through pipes, 832
" , density maximum, probable value of, 1714
" , density at various temperatures, 1376-8
" , drinking standards, 750
" , flow of, in cast iron pipe, 825-33
" for industrial use, 740-3
" , refractive index of, 1036
" softening requirements, formulas for, 751
" , specific heat of, at various temperatures, 1517
" , surface tension at various temperatures, 1577
" , vapor pressures at various temperatures, 1443-9
" , viscosity of, at various temperatures, 1594
" , volume of, at various temperatures, 1376-7
Watt, definition of, 1662
Wave, *M 29-30*
" length, *M 29-30*
" length associated with one abs-volt, probable value of, 1715
" length of the principal lines of the spectra of the elements, 1069-92
" number associated with one abs-volt, probable value of, 1715
Wax, definition of, 1662
" , for desk top dressing, 169[illegible]
Waxes, constants of, 678-85
Weighings in air conversion to in vacuo, 1754
Weight of aqueous solutions, 1270-1373
" , atomic, 6-7
" , atomic, changes, 83-6
" , of cast metals, 774-5
" , ceramic equivalent, 878-82
" , equivalent, definition of, 1646
" , gram-atomic, definition of, 1648
" , gram-molecular, definition of, 1648
" , molecular, definition of, 1653
" , molecular, of gases, equations for, 1632
" , molecular, of solutes, equation for, 1635
" units and conversion factors, 1716-51
" of U. S. coins (approximate), 1755
Weights, density of various, 1754
Weir, definition of, 1662
" formulas, 836-9
Weston normal cell, 1095
" speed, comparison with other ratings, 1684
" speed of photographic emulsions, 1685-8
Wet and dry bulb readings for hygrometry, 1406-11
Wien's displacement constant, probable value of, 1715
Wijs' solution for iodine number, 1172
Wine, definition of, 1671
Wire, copper, tables, 843-4
" gages, AWG and B & S, 840-4
" for heating elements, 840-3
Wood, chemical resistance of, 792-5
" , composition of various, 752-3
" for pattern making, 775
" , physical properties of, 775; 799
" stain, black, acid proof, 1696
Work, *M 56*
" , differential of, *M 56*
" , dimensional formula, 1712
" units and conversion factors, 1716-51

X

X-ray, definition of, 1662
" tables, 1050-60

Y

Yard, U. S. standard, conversion factors, 1716-51
Yield strength, definition of, 1662
" strength of cast metals, 774-5
Young's modulus, dimensional formula, 1711

Z

Zeeman displacement per gauss, probable value of, 1715
Zeiss immersion refractometer readings, 1038-44
Zero, absolute, definition of, 1639
Zinc bromide, specific gravity of aqueous solutions, 1359
" chloride, density of aqueous solutions, 1344-6
" iodide, specific gravity of aqueous solutions, 1359
" , nickel, cobalt, separation of, 1126
" nitrate, density of aqueous solutions, 1346-8
" salts, poisoning, treatment of, 5
" sulfate, density of aqueous solutions, 1348-50
Zinc, *M 56*
